D	Discussion	number of seats being elected.		can not select another choice.	expected.	Overview > VxMark Function
		For straight-party voting, the voting system must be able to provide a contest in which a voter may select				
		political party contest choices that result in the selection of all partisan contests on their ballot. In this instance,				
		a selection of a political party choice automatically selects all contest choices associated with that party. The voting system must be capable of gathering and recording votes for both this contest and all partisan contests				
1.1.4-K	Straight-party voting, Casting	associated with it.				
		Straight-party voting is a voting variation used in a general election. It provides the voter with the ability to				
		select all candidates affiliated with a desired party in all partisan contests on the ballot by selecting one contest				
		option. When a party is selected, the system must not prevent the selection of individual candidate options that				
		may negate the original straight-party choice, nor must it require that voters utilize the straight-party voting option. Rules for determining the candidate choices resulting from the combination of direct option selections				
D	Discussion	and straight-party option selections are determined by the rules in states that use straight-party voting.		N/A - Not included in implementation statement.		
		For a cumulative voting contest, the voting system must be capable of gathering and recording votes in a contest				
		where the voter may allocate no more than the allowed number of votes to one or more contest selections in				
1.1.4-L	Cumulative voting contest, Casting	whole vote increments.				
		When a cumulative voting contest is on a ballot, the system must allow the voter to assign all allowed votes to any desired contest selection or to any set of contest selections in whole vote increments. The total of all				
		selection assignments must not exceed the total votes allowed. (See 1.1.4-Q - Proportional voting contest				
		(equal-and-even cumulative voting contest), Casting for an alternate method of assigning multiple votes to a				
D	Discussion	candidate.)		N/A - Not included in implementation statement.		
		For a ranked choice voting (RCV) contest, the voting system must be capable of gathering and recording votes in a contest where the voter must be able to rank contest selections in order of preference, as first choice, second				
1.1.4-M	Ranked choice voting contest, Casting	choice, etc.				
		The ballot presentation of a RCV contest is independent of the number of seats being elected. Depending on				
		jurisdictional rules, the number of choice options provided may vary from a minimum of 3 to the number of				
_		contest choices on the ballot. Contest outcome determination requires cast vote records (CVR) to be processed				
D	Discussion	post-election. For a party preference contest, the voting system must be capable of gathering and recording votes for a contest		N/A - Not included in implementation statement.		
		containing a list of political party choices. In this instance, the voting system uses a valid selection of a party in				
		the contest, which limits gathering and recording of votes in all partisan contests on the ballot to those				
1.1.4-N	Party preference contest	associated with the selected party.				
		A party preference contest only appears on an open primary ballot when required by state rules. Its purpose is				
D	Discussion	to allow the voter to select the party they intend to vote contests for and prevent the voter from spoiling the partisan section of the ballot by, for example, marking contests in a different party's section of the ballot.		N/A - Not included in implementation statement.		
U	DISCUSSION	For a top-2 primary contest, the voting system must be capable of assigning candidates of all relevant parties to		1977 Not meladed in implementation statement.		
1.1.4-0	Top-2 primary contest (blanket primary contest)	a single seat contest which is also assigned to all partisan ballots.				
		In some states, this method is required to be used to fill designated partisan offices. The contest, also called a				
		blanket primary contest, appears on all party-specific primary ballots. All candidates are listed as contest options				
D	Discussion	including their party affiliation. The 2 candidates who receive the most votes will be on the general election ballot independent of their party affiliation.		N/A - Not included in implementation statement.		
U	DISCUSSION	For a presidential delegate contest, the voting system must be capable of gathering and recording votes for only		Not included in implementation statement.		
1.1.4-P	Presidential delegate contest, Casting	those delegates that are affiliated with the voter's choice in the presidential preference contest.				
		Presidential delegate voting is a voting variation that only is used in a presidential primary election on a party-				
		specific primary ballot where delegates to the convention are selected by the voter when the method is selected				
		by a state's political party. With this method, only contest option selections in delegate contests that are				
D	Discussion	pledged to the voter's presidential candidate selection will be recorded. If the voter does not make a selection in the presidential preference contest, selections for presidential delegates will not be recorded.		N/A - Not included in implementation statement.		
U	DISCUSSION	For a proportional voting contest, the voting system must be capable of gathering and recording votes for a		1977 Not meladed in implementation statement.		
	Proportional voting contest (equal-and-even cumulative voting	contest which allow multiple votes to be assigned to a candidate. This is accomplished by prorating the number				
1.1.4-Q	contest), Casting	of allowed votes proportionally to the number of validly selected candidates.

1.1.8-H	N-of-M contest, Tabulation	For N-of-M voting, the voting system must be capable of tabulating votes, overvotes, and undervotes in contests where the voter is permitted to select up to a specified number of contest choices.				
1.1.o-n	N-01-IVI COITIEST, TABUIATION	An N-of-M contest is one where a voter is allowed N contest selections from a list of M choices and where votes				
		are tallied independent of any other contest choices. N includes 1 vote (1 vote for 1 contest or typically a				
		measure) or any larger number. Contest choices include those where the contest choices are candidates for a				
		specific office or measures/referenda where there are usually only two contest choices (Yes/No, For/Against) but may also be a list of choices (Tax rate A, Tax rate B, Tax rate C). An N-of-M contest is used for approval voting by				
		setting N to be equal to M. This type of contest is used for limited voting by setting N to be less than the number		N-of-M tabulation follows the tabulation rules for votes,		
		of seats being elected. An N-of-M contest is also is used for top-2 primary contests (blanket primary contests),		overvotes, and undervotes as described in the discussion of		System Performance and Specifications
D	Discussion	where N is always 1 but the 2 candidates with the most votes will be on the general election ballot.		this requirement.	that tabulation of N-of-M contests follows these rules.	> Supported Voting Variations
		For cumulative voting, the voting system must be capable of tabulating votes, overvotes, and undervotes in contests where the voter may allocate up to a specified number of votes over a list of contest choices in any				
1.1.8-l	Cumulative voting contest, Tabulation	manner they choose. This may result in possibly giving more than one vote to a given contest selection.		N/A - not included in implementation statement		
1.1.8-J	Ranked choice voting contest, Tabulation	For ranked choice voting (RCV), the voting system must				
1.1.8-J.1		capture the voter's ranking of each contest selection and store it in the CVR associated with the ballot style				
1.1.8-J.2		aggregate 1st choice totals of each contest selection		-		
1.1.8-J.3		process the collection of CVRs round-by-round according to the method specified in the implementation statement				
11210 010		Ranked choice voting (RCV) tabulation methods are different for single seat and multi-seat contests.				
		Jurisdictional rules vary even when using the same basic method. A voting unit or precinct tabulating unit cannot				
		perform RCV tabulation. RCV tabulation requires the concurrent availability of all CVRs associated with an RCV contest and is a post-voting accumulation/aggregation process. Some jurisdictional rules may only require use				
		of the RCV tabulation process if aggregated first choice selections do not produce the total needed to exceed the				
		threshold of votes required to win. Other jurisdictional rules do not use tabulated and aggregated 1st choice				
		selections and require the RCV tabulation process to be used for all winners. Single winner RCV is also known as				
D	Discussion	IRV (Instant Runoff Voting). STV (Single Transferable Vote) is a method used for multi-winner RCV. Another multi-winner process (Sequential At-Large IRV) uses successive IRV passes, one pass to determine each winner.		N/A - not included in implementation statement		
5	21504331011	When tabulating group voting contest choices, the voting system must automatically select each contest choice		14/7 Hot medded in implementation statement

	High Quality Implementation - The voting system is implemented				· ·	
2	using high quality best practices					
	The voting system and its software are implemented using trustworthy materials and best practices in software					
2.1	development					
2.1-A	Acceptable programming languages	Application logic must be produced in a high-level programming language that has all of the following control constructs:				
2.1-A.1 2.1-A.2		sequence loop with exit condition (for example, for, while, or do-loops)				
2.1-A.2 2.1-A.3		if/then/else conditional				
2.1-A.4		case conditional				
2.1-A.5		block-structured exception handling (for example, try/throw/catch)				
		A list of acceptable programming languages may be specified by the EAC in conjunction with voting system test labs. This requirement can be satisfied by using COTS extension packages to add missing control constructs to languages that could not otherwise conform. By excluding border logic, this requirement allows the use of assembly language for hardware-related segments, such as device controllers and handler programs. It also allows the use of an externally imposed language for interacting with an Application Program Interface (API) or database query engine. However, the special code should be insulated from the bulk of the code, for example, by wrapping it in callable units expressed in the prevailing language to minimize the number of places that special code appears. Previous versions of VVSG required voting systems to handle such errors by some means, preferably using programming language exceptions ([VVSG2005] I. 5.2.3.e), but there was no unambiguous requirement for the programming language to support exception handling. These guidelines require programming language exceptions because without them, the programmer must check for every possible error condition in every possible location, which both obfuscates the application logic and creates a high likelihood that some or many possible errors will not be checked. Additionally, these guidelines require block-structured exception handling because, like all unstructured programming, unstructured exception handling obfuscates logic and makes its verification by the test lab more difficult. "One of the major difficulties of conventional defensive programming is that the fault tolerance actions are inseparably bound in with the normal processing which the design is to provide. This can significantly increase design complexity and, consequently, can compromise the reliability and maintainability of the software." [Moulding89] Existing voting system logic implemented in programming languages that do not support block-structured exception handling onto the previo		The VotingWorks codebase is written in TypeScript and Rust, two widely used languages that	We put significant consideration into the	
D	Discussion	arise, whereas in a programming environment that had exceptions to begin with the analogous library functions would already do this (see Requirement 2.1-B – COTS language extensions are acceptable).		have all of the listed control constructs.	introduction of new languages to our codebase.	System Overview > Software Overview > Software Best Practices
2.1-B	COTS language extensions are acceptable	Requirement 2.1-A – Acceptable programming languages may be satisfied by using COTS extension packages to add missing control constructs to languages that could not otherwise conform.		N/A - We meet requirement 2.1-A without the need for this	COUCLOSE.	Software Dest Fractices
D	Discussion	The use of non-COTS extension packages or manufacturer-specific code for this purpose is not acceptable, as it would place an unreasonable burden on the test lab to verify the soundness of an unproven extension (effectively a new programming language). The package must have a proven track record of performance supporting the assertion that it would be stable and suitable for use in voting systems, just as the compiler or interpreter for the base programming language must.		extension.		
2.1-C	Acceptable coding conventions	Application logic must adhere to a published, credible set of coding rules, conventions, or standards (called "coding conventions") that enhance the workmanship, security, integrity, testability, and maintainability of applications.		be found here: https://github. com/votingworks/vxsuite/blob/m ain/docs/best_practices/typescrip t.md; https://github. com/votingworks/vxsuite/blob/m	We make use of automatic code linters to enforce best practices and also require peer code review of every change, during which we check for issues like this. If a code linter finds an issue with a code change, our continuous integration tool, CircleCl, fails and prevents the code from being merged until the issue is addressed.	System Overview > Software Overview > Software Best Practices
D	Discussion	Coding conventions may be specified by the EAC in conjunction with voting system test labs. The requirement to follow coding conventions serves two purposes. First, by requiring specific risk factors to be mitigated, coding conventions support integrity and maintainability of voting system logic. Second, by making the logic more transparent to a reviewer, coding conventions facilitate test lab evaluation of the logic's correctness to a level of assurance beyond that provided by operational testing. The source code review for workmanship now focuses on coding practices with a direct impact on integrity and transparency and on adherence to published, credible coding conventions, in lieu of coding conventions embedded within the standard itself. The vast majority of coding conventions used in practice are tailored to specific programming languages. In these guidelines, the few coding conventions that have significant impact on integrity and transparency and that generalize relatively well to different programming languages have been retained, expanded, and made mandatory, while the many coding conventions that are language sensitive and stylistic in nature, and are made redundant by more recent, publicly available coding conventions, have been removed in favor of the published conventions. As discussed, prescriptive coding conventions not directly related to integrity and transparency have been avoided in favor of published, credible conventions. Coding conventions are considered to be published if they appear in a publicly available book, magazine, journal, or new media with analogous circulation and availability, or if they are publicly available on the Internet. This requirement attempts to clarify the "published, reviewed, and industry-accepted" language appearing in previous iterations of the VVSG, but the intent of the requirement is unchanged. Coding conventions are considered to be credible if at least two different organizations with no ties to the creator of the rules or to the manufacturer seeking confo

2.1-A.4		how the results of those methods contributed to developing the final features and design of the voting system		documentation.	VotingWorks staff reviews all documentation.	
D	Discussion	The goal of this requirement is to allow the manufacturer to demonstrate, through the report, the way their implementation process included user-centered design methods. ISO-9241-210:2019 Ergonomics of human-system interaction—Part 210: Human-centered design for interactive systems [ISO19b] provides requirements and recommendations for human-centered principles and activities throughout the life cycle of computer-based interactive systems. It includes the idea of iterative cycles of user research to understand the context of use and user needs, creating prototypes or versions, and testing to confirm that the product meets the identified requirements. This requirement does not specify the exact user-centered design methods to be used, or their number or timing. The ISO group of requirements, Software engineering Software product Quality Requirements and Evaluation (SQUARE) Common Industry Format (CIF) for Usability includes several standards that are a useful framework for reporting on user-centered design activities and usability reports: ISO/IEC TR 25060:2010: General framework for usability-related information [ISO10] ISO/IEC 25063:2014: Context of use description [ISO14]•ISO/IEC 25062:2006: Usability test reports [ISO06b] ISO/IEC 25064:2013: User needs report [ISO13b] ISO/IEC 25066:2016 Evaluation report [ISO16]				
2.3	Voting system logic is clear, meaningful, and well-structured			M.C. ita analization la sia bandla		
2.3-A	Block-structured exception handling	Application logic must handle exceptions using block-structured exception handling constructs.		VxSuite application logic handles exceptions using block-structured exception handling contructs in TypeScript and Rust code.	We make use of automatic code linters to enforce best practices and also require peer code review of every change.	System Overview > Software Overview > Software Best Practices
D	Discussion	The concept of "block-structured exception handling," is the ability to associate exception handlers with blocks of logic, and implicitly, the presence of the exception concept in the programming language. (This simply means try/throw/catch or equivalent statements and should not be confused with the specific implementation known as Structured Exception Handling (SEH) [MS20].[2]) Unlike deeply nested blocks, exceptions cannot be eliminated by restructuring logic. "When exceptions are not used, the errors cannot be handled but their existence is not avoided." [ISO00] Previous versions of VVSG required voting systems to handle such errors by some means, preferably using programming language exceptions ([VVSG2005] I.5.2.3.e), but there was no unambiguous requirement for the programming language to support exception handling. These guidelines require programming language exceptions because without them, the programmer must check for every possible error condition in every possible location, which both obfuscates the application logic and creates a high likelihood that some or many possible errors will not be checked. Additionally, these guidelines require block-structured exception handling because, like all unstructured programming, unstructured exception handling obfuscates logic and makes its verification by the test lab more difficult. "One of the major difficulties of conventional defensive programming is that the fault tolerance actions are inseparably bound in with the normal processing which the design is to provide. This can significantly increase design complexity and, consequently, can compromise the reliability and maintainability of the software." [Moulding89].				
2.3-B	Legacy library units	If application logic makes use of any COTS or third-party logic callable units that do not throw exceptions when exceptional conditions occur, those callable units must be wrapped in callable units that check for the relevant error conditions and translate them into exceptions, and the remainder of application logic must use only the wrapped version.		VotingWorks application logic that calls third-party libraries or hardware drivers is wrapped in callable units that check for relevant error conditions and translate them appropriately.	We make use of automatic code linters to enforce best practices and also require peer code review of every change.	System Overview > Software Overview > Software Best Practices
D	Discussion	Existing voting system logic implemented in programming languages that do not support block structured exception handling can be brought into compliance either through migration to a newer programming language (most likely, a descendant of the same language that would require minimal changes) or through the use of a COTS package that retrofits block-structured exception handling onto the previous language with minimal changes. While the latter path may at first appear to be less work, it should be noted that many library functions may need to be adapted to throw exceptions when exceptional conditions arise, whereas in a programming environment that had exceptions to begin with the analogous library functions would already do this.				
2.3-C	Separation of code and data	Application logic must not compile or interpret configuration data or other input data as a programming language.		VotingWorks application logic does not compile or interpret configuration data or other input data as a programming language, and makes sure to properly escape input data to avoid any possible risks like SQL injection.	We make use of automatic code linters to enforce best practices and also require peer code review of every change.	System Overview > Software Overview > Software Best Practices
	Discussion	The applicable requirement in VVSG2005 reads "Operator intervention or logic that evaluates received or stored data must not re-direct program control within a program routine." That attempt to define what it means to compile or interpret data as a programming language caused confusion. Distinguishing what is a programming language from what is not requires some professional judgment. However, in general, sequential execution of imperative instructions is a characteristic of conventional programming languages that should not be exhibited by configuration data. Configuration data must be declarative or informative in nature, not imperative. For example: Configuration data can contain a template that informs a report generating application about the form and content of a report that it should generate. However, configuration data cannot contain instructions that are executed or interpreted to generate a report, essentially embedding the logic of the report generator inside the configuration data. The reasons for this requirement are mingling code and data is bad design, and embedding logic within configuration data evades the conformity assessment process for application			. •	
D	Discussion	logic.				
2.3-D	Hard-coded passwords and keys	Voting system software must not contain hard-coded, including the use of:		VotingWorks application logic does not use or reference any	We require peer code review of every change, during which we check for issues like	System Overview > Software Overview > Software Best Practices; System Security,

2.3-D.2	Discussion	cryptographic keys Many examples of this vulnerability have previously been identified in voting system software. Additional information about this vulnerability can be found at MITRE CWE-259: Use of Hard-coded Password [MITRE20a] and MITRE CWE-321: Use of Hard-coded Cryptographic Key [MITRE20b].		cryptographic keys.	conduct penetration tests of our system.	Architecture
2.3.1	Software flow	Cryptographic ney (minitezou).				
2.3.1-A	Unstructured control flow	Application logic must contain no unstructured control constructs.		VotingWorks application logic does not contain any unstructured control constructs. Application logic is written in TypeScript and Rust which are structured languages that do not use unstructured control constructs.	We make use of automatic code linters to enforce best practices and also require peer code review of every change.	System Overview > Software Overview > Software Best Practices

2

VVSG 2.0 Sectio	n Title	Requirement/Discussion Text	Related Requirements	How VxSuite Meets	How VotingWorks Tests	TDP Reference
D	Discussion	Although it is typically developed by the voting system manufacturer, border logic is constrained by the requirements of the third-party or COTS interface with which it interacts. It is not always possible for border logic to achieve its function while conforming to standard coding conventions. For this reason, border logic should be minimized relative to application logic and where possible, wrapped in a conforming interface. An example of border logic that could not be so wrapped is a customized boot manager that connects a bootable voting application to a COTS BIOS.				
2.3.1-B	Goto	Arbitrary branches (also known as gotos) must not be used.		VotingWorks application logic does not contain any gotos. Application logic is written in TypeScript and Rust which are structured languages that do not support gotos.	We make use of automatic code linters to enforce best practices and also require peer code review of every change.	System Overview > Software Overview > Software Best Practices
2.3.1-C	Intentional exceptions	Exceptions must only be used for abnormal conditions. Exceptions must not be used to redirect the flow of control in normal ("non-exceptional") conditions.		VotingWorks application logic does not use exceptions to redirect the flow of control.	We make use of automatic code linters to enforce best practices and also require peer code review of every change.	System Overview > Software Overview > Software Best Practices
D	Discussion	"Intentional exceptions" cannot be used as a substitute for arbitrary branch. Normal, expected events, such as reaching the end of a file that is being read from beginning to end or receiving invalid input from a user interface, are not exceptional conditions and should not be implemented using exception handlers.		Teamest the new or control	cocciencii o etc., ciai,gc.	
2.3.1-D	Unstructured exception handling	Unstructured exception handling (for example, On Error GoTo, setjmp/longjmp, or explicit tests for error conditions after every executable statement) is prohibited.		VotingWorks application logic does not use unstructured exception handling. Application logic is written in TypeScript and Rust which are structured languages that do not support unstructured exception handling.	We make use of automatic code linters to enforce best practices and also require peer code review of every change.	System Overview > Software Overview > Software Best Practices
D	Discussion	The internal use of such constructs by a COTS extension package that adds block-structured exception handling to a programming language that otherwise would not have it, as described in requirement 2.3-B – Legacy library units, is allowed. Similarly, it is not a problem that source code written in a high-level programming language is compiled into low-level machine code that contains arbitrary branches. It is only the direct use of low-level constructs in application logic that presents a problem.		a sa a caracter a succession in a succession i	code renew or energy analogo.	
2.4 2.4-A	Voting system structure is modular, scalable, and robust	Application logic must be decisioned in a modular feeblor, meeting all the exitoric stated in the definition of a modular parally that		_		
2.4-A 2.4-A.1	Modularity	Application logic must be designed in a modular fashion, meeting all the criteria stated in the definition of a module, namely that: It must be a structural unit of software or analogous logical design.		_		
2.4-A.1 2.4-A.2		If it contains callable units, those callable units must be tightly coupled.		+		
2.4-A.3		Coupling between modules ("inter-module coupling") must:		1		
2.4-A.3.a		be losse, and		1		
2.4-A.3.b		occur over defined interfaces.		1	We require peer code review of every	
2.4-A.4		It must contain all elements needed to compile or interpret successfully.		1	change, during which we encourage modular design and appropriate abstractions. For	
2.4-A.5		It must have limited access to data in other modules.		VotingWorks application logic is	larger changes and features, we hold	System Overview > Software Overview >
2.4-A.6		It must be substitutable with another module whose interfaces match the original module.		designed in a modular fashion.	architecture discussions as a team.	Software Best Practices
D	Discussion	The modularity rules described here apply to the component submodules of a library.				
2.4-B	Module testability	Each module must have a specific function that can be tested and verified independently of the remainder of the code.		VotingWorks application logic is written with testability in mind.	Code coverage tooling ensures that our code is thoroughly tested.	Quality Assurance Manual > Quality Assurance Protocols – Software
D	Discussion	In practice, some additional modules (such as library modules) can be needed to compile the module being tested, but the modular construction allows the supporting modules to be replaced by special test versions that support test objectives.				
2.4-C	Module size and identification	Modules must be small and easily identifiable, such as being:				
2.4-C.1		no more than 50% of all callable units (functions, methods, operations, subroutines, procedures, etc.) SHOULD exceed 25 lines of code				
		in length, excluding comments, blank lines, and initializers for read-only lookup tables		VotingWorks application logic is	We make use of automatic code linters to	
2.4-C.2		no more than 5% of all callable units SHOULD exceed 60 lines in length		broken up into small digestible	enforce best practices and also require peer	System Overview > Software Overview >

VVSG 2.0 Section	Title	Requirement/Discussion Text Re	elated Requirements	How VxSuite Meets	How VotingWorks Tests	TDP Reference
D	Discussion	This prohibits the use of arbitrary, nonstandard compilers and, consequently, the invention of new programming languages.			-	
2.5.1-B	Interpreted code, specific COTS interpreter	If interpreted code is used, it must only be run under a specific, identified version of a COTS runtime interpreter.	l t	N/A - VotingWorks application logic does not use any traditionally interpreted languages.		
D	Discussion	This ensures that: no arbitrary, nonstandard interpreted languages are used, and the software tested and approved during the conformity assessment process does not change behavior because of a change to the interpreter.				
2.5.1-C	Prevent tampering with code	Programmed devices must prevent replacing or modifying executable or interpreted code (for example, by other programs on the system, by people physically replacing the memory or medium containing the code, or by faulty code) except where this access is necessary to conduct the voting process.		Our system integrity mechanism prevent this.	If our code was self-modifying and was somehow modified, our system integrity / Secure Boot checks would fail, and a machine would not boot, alerting us to the issue.	System Security, Auditing, & Logging > System Security Architecture > System Integrity
D	Discussion	This requirement can be satisfied through a combination of: read-only memory (ROM), the memory protection implemented by most popular COTS operating systems, error checking, and access and integrity controls.				
2.5.1-D	Prevent tampering with data	All voting devices must prevent access to or manipulation of configuration data, vote data, or audit records (for example, by physically tampering with the medium or mechanism containing the data, by other programs on the system, or by faulty code) except where this access is necessary to conduct the voting process.		We have multiple layers of protection here: 1) artifact authentication, which prevents modification of records on USB drives, 2) authenticated encryption of the /var partition, which prevents modification of records on disk, including if the drive is removed from the machine, and 3) a strict system user setup that limits which system users have write access.		System Security, Auditing, & Logging > System Security Architecture > Artifact Authentication; System Security, Auditing, & Logging > System Security Architecture > System Integrity > Protecting Critical Read-Write Data; System Security, Auditing, & Logging > System Security Architecture > Defense-in-Depth and Least Privilege
		This requirement can be satisfied through a combination of: the memory protection implemented by most popular COTS operating systems, error checking, and access and integrity controls. Systems using mechanical counters to store vote data need to protect the counters from tampering. If vote data are stored on paper, the paper needs to be protected from tampering. Modification of audit				
D 2.5.2	Discussion	records after they are created is never necessary.				
2.5.2 2.5.2-A	Input/output errors Input validation and error defense	The voting system must:				
2.5.2-A 2.5.2-A.1	input validation and error defense	The voting system must:				
2.5.2-A.1 2.5.2-A.2		monitor I/O operations validate all input against expected parameters, such as data presence, length, type, format, uniqueness, or inclusion in a set of whitelisted values	I	VotingWorks application logic validates inputs. Inputs that fail	VotingWorks functional and automated testing confirms that I/O operations are	System Overview > Election Package; System Overview > Cast Vote Records; System Overview > VxAdmin Function;
2.5.2-A.3		report any input errors and how they were corrected		validation trigger a warning to the		System Security, Auditing, & Logging >
2.5.2-A.4		check information inputs to ensure that incomplete or invalid inputs do not lead to irreversible error.	ı	user.	warning.	Artifact Authentication
		Input includes data from any input source: input devices (such as touch screens, keyboards, keypads, optical/digital scanners, and assistive devices), networking port, data port, or file. This general requirement applies to all programmed devices, while the specific				
D	Discussion	ones following are only enforceable for application logic.				
2.5.3 2.5.3-A	Output protection					
D D	Escaping and encoding output Discussion	Software output must be properly encoded, escaped, and sanitized. The output of a software module can be manipulated or abused by attackers in unexpected ways to perform malicious actions. Ensuring that outputted data is of an expected type or format assists in preventing this abuse. Additional information about this software				
		weakness can be viewed at MITRE CWE 116: Improper Encoding or Escaping of Output [MITRE20c]. The voting system must sanitize all output to remove or neutralize the effects of any escape characters, control signals, or scripts				
2.5.3-B	Sanitize output	contained in the data which could adversely manipulate the output source. Output includes data to any output source: output devices (such as touch screens, LCD screens, printers, and assistive devices),				
D	Discussion	networking port, data port, or file. This applies to all parts of the voting system including the election management system (EMS).				
2.5.3-C	Stored injection	The voting system must sanitize all output to files and databases to remove or neutralize the effects of any escape characters, control signals, or scripts contained in the data which could adversely manipulate the voting system if the stored data is read or imported at a later date or by another part of the voting system.				
D	Discussion	A stored injection attack saves malicious data which is harmless when stored, but which is potent when read later in a different context or when converted to a different format. For example, a malicious script might be written to a file and do no harm to the voting machine, but later be evaluated and harmful when the file is transferred and read by the EMS. Input should also be filtered, but sanitizing stored output provides defense in depth.		VotingWorks application logic sanitizes output.	We make use of automatic code linters to enforce best practices and also require peer code review of every change.	System Overview > Software Overview > Software Best Practices
2.5.4	Error Handling			•	, 3-	
2.5.4-A	Mandatory internal error checking	Application logic that is vulnerable to the following types of errors must check for these errors at run time and respond defensively when they occur:				
2.5.4-A.1		common memory management errors, such as out-of-bounds accesses of arrays, strings, and buffers used to manage data				
2.5.4-A.2		uncontrolled format strings				
2.5.4-A.3		CPU-level exceptions such as address and bus errors, dividing by zero, and the like				
2.5.4-A.4		variables that are not appropriately handled when out of expected boundaries				
2.5.4-A.5		numeric and integer overflows	\	VotingWorks application logic	We make use of automatic code linters to	
2.5.4-A.6		validation of array indices		performs these checks and exits	enforce best practices and also require peer	System Overview > Software Overview >
2.5.4-A.7		known programming language specific vulnerabilities		quickly when these checks fail.	code review of every change.	Software Best Practices
D	Discussion	Logic verification will show that some error checks cannot logically be triggered, and some exception handlers cannot logically be invoked. These checks and exception handlers are not redundant – they provide defense-in-depth against faults that escape detection during logic verification.				
2.5.4-B	Array overflows	If the application logic uses arrays, vectors, or any analogous data structures, and the programming language does not provide automatic run-time range checking of the indices, the indices must be ranged-checked on every access.	1	VotingWorks application logic performs these checks and exits quickly when these checks fail.	We make use of automatic code linters to enforce best practices and also require peer code review of every change.	System Overview > Software Overview > Software Best Practices
	+	<u> </u>	,	, ,		

2

VVSG 2.0 Section	Title	Requirement/Discussion Text	Related Requirements	How VxSuite Meets	How VotingWorks Tests	TDP Reference
D	Discussion	Range checking code should not be duplicated before each access. Clean implementation approaches include: consistently using dedicated accessors (such as functions, methods, operations, subroutines, and procedures) that range-check the indices; defining and consistently using a new data type or class that encapsulates the range-checking logic; declaring the array using a template that causes all accessors to be range-checked; or declaring the array index to be a data type whose enforced range is matched to the size of the array. Range-enforced data types or classes can be provided by the programming environment or they can be defined in application logic. If acceptable values of the index do not form a contiguous range, a map structure can be more appropriate than a vector.	·		•	
2.5.4-C	Buffer overflows	If an overflow does not automatically result in an exception, the application logic must explicitly check for and prevent the overflow.		N/A - An overflow will automatically result in an exception.		
2.5.4-D	CPU traps	The application logic must implement such handlers as needed to detect and respond to CPU-level exceptions.		VotingWorks application logic handles CPU-level exceptions.	We make use of automatic code linters to enforce best practices and also require peer code review of every change.	System Overview > Software Overview > Software Best Practices
D	Discussion	For example, under Unix, a CPU-level exception would manifest as a signal, so a signal handler is needed. If the platform supports it, it is preferable to translate CPU-level exceptions into software-level exceptions so that all exceptions can be handled in a consistent fashion within the voting application. However, not all platforms support it.		·	, G	
2.5.4-E	Garbage input parameters	All scalar or enumerated type parameters whose valid ranges as used in a callable unit (such as function, method, operation, subroutine, and procedure) do not cover the entire ranges of their declared data types must be range-checked on entry to the unit.		VotingWorks application logic performs these checks and exits quickly when these checks fail.	We make use of automatic code linters to enforce best practices and also require peer code review of every change.	System Overview > Software Overview > Software Best Practices
D	Discussion	This applies to parameters of numeric types, character types, temporal types, and any other types for which the concept of range is well-defined. In cases where the restricted range is frequently used or associated with a meaningful concept within the scope of the application, the best approach is to define a new class or data type that encapsulates the range restriction, eliminating the need for range checks on each use. This requirement deals with user input that is expected to contain errors. User input errors are a normal occurrence; the errors discussed here are grounds for throwing exceptions.				
2.5.4-F	Numeric overflows	If the programming language does not provide automatic run-time detection of numeric overflow, all arithmetic operations that could potentially overflow the relevant data type must be checked for overflow.		VotingWorks application logic performs these checks and exits quickly when these checks fail.	We make use of automatic code linters to enforce best practices and also require peer code review of every change.	System Overview > Software Overview > Software Best Practices
D	Discussion	Encapsulate overflow checking as much as possible.			, 0	
2.5.4-G	Uncontrolled format strings	Voting system software must not contain uncontrolled format strings.		VotingWorks application logic does not contain uncontrolled format strings.	We make use of automatic code linters to enforce best practices and also require peer code review of every change.	System Overview > Software Overview > Software Best Practices
_		Many examples of this vulnerability have previously been identified in voting system software. Additional information about this				
D 25.411	Discussion Description of integral array sheeking	vulnerability can be found at MITRE CWE 134: Use of Externally-Controlled Format String [MITRE20d]. Application logic that is vulnerable to the following types of errors must check for these errors at run time and respond defensively				
2.5.4-H	Recommended internal error checking	when they occur:				
2.5.4-H.1 2.5.4-H.2		pointer variable errors dynamic memory allocation and management errors		\/\	We make you of a standard and a lintage to	
		If application logic uses pointers or a similar mechanism for specifying absolute memory locations, the application logic must validate		VotingWorks application logic performs these checks and exits	We make use of automatic code linters to enforce best practices and also require peer	System Overview > Software Overview >
2.5.4-1	Pointers	these pointers or addresses before they are used.		quickly when these checks fail.	code review of every change.	Software Best Practices
D	Discussion	The goal is to prevent improper overwriting, even if read-only memory would prevent the overwrite from succeeding. An attempted overwrite indicates a logic fault that must be corrected. Pointer use that is fully encapsulated within a standard platform library is treated as COTS software.				
2.5.4-J	Memory mismanagement	If dynamic memory allocation is performed in application logic, the application logic must be able to be instrumented or analyzed with a COTS tool for detecting memory management errors.		TypeScript does not support dynamic memory allocation. Rust does but also has an ownership model that ensures memory safety.		System Overview > Software Overview > Software Best Practices
D	Discussion	Dynamic memory allocation that is fully encapsulated within a standard platform library is treated as COTS software.		Janety.		Software Dest Fractices
2.5.4-K	Nullify freed pointers	If pointers are used, any pointer variables that remain within scope after the memory they point to is deallocated must be set to null or marked as invalid (pursuant to the idiom of the programming language used).		TypeScript does not support dynamic memory allocation. Rust does but also has an ownership model that ensures memory safety.		System Overview > Software Overview > Software Best Practices
D	Discussion	If this is not done automatically by the programming environment, a callable unit should be dedicated to the task of deallocating memory and nullifying pointers. Equivalently, "smart pointers" like the C++ std::auto_ptr can be used to avoid the problem. One should not add assignments after every deallocation in the source code. In languages using garbage collection, memory is not deallocated until all pointers to it have gone out of scope, so this requirement is moot.				
2.5.4-L	React to errors detected	Detecting any of the errors enumerated in these requirements must be treated as a complete failure of the callable unit in which the error was detected.		VotingWorks application logic performs these checks and exits quickly when these checks fail.	We make use of automatic code linters to enforce best practices and also require peer code review of every change.	System Overview > Software Overview > Software Best Practices
2.5.4-L.1		An appropriate exception must be thrown				
2.5.4-L.2		Control must pass out of the unit immediately		-		
2.5.4-M	Election integrity monitoring	Electronic devices must proactively detect or prevent basic violations of election integrity (for example, stuffing the ballot box or accumulating negative votes) and alert an election official or administrator if they occur.				
D	Discussion	Equipment can only verify those conditions that are within the scope of what the equipment does. However, if the equipment can detect something that is blatantly wrong, it should do so and raise the alarm. This provides defense-in-depth to supplement procedural controls and auditing practices.				
2.5.4-N	SQL injection	The voting system application must defend against SQL injection.		VotingWorks application logic defends against SQL injection.	We make use of automatic code linters to enforce best practices and also require peer code review of every change.	System Overview > Software Overview > Software Best Practices
D	Discussion	SQL injection is a classic type of software weakness still prevalent today. SQL injection is not just a web-based issue, as any application accepting untrusted user input and passing it to a database can be vulnerable. Additional information about this software weakness can be viewed at MITRE CWE 89: Improper Neutralization of Special Elements used in an SQL Command ('SQL Injection') [MITRE20e].				
2.5.4-0	Parameterized queries	Any structured statement or command being prepared using dynamic data (including user input) to be sent to a database or other process must parameterize the data inputs and apply strict type casting and content filters on the data (such as prepared statements).		VotingWorks application logic uses parameterized queries.	We make use of automatic code linters to enforce best practices and also require peer code review of every change.	System Overview > Software Overview > Software Best Practices
D	Discussion	Parameterized queries are a common defense against this class of software weakness.		assa parameterizea queries.	code review or every change.	Software best ridences

3.1.4	Software installation documentation	accurate.		Security, Auditing & Logging.	VotingWorks staff reviews documentation.	Procedure
3.1.4-A	Software installation documentation	The manufacturer must provide software installation documentation that lists all software to be installed on the programmed devices of		1		
		the voting system and the installation software used to install the software in the user documentation.				
_		Software to be installed on programmed devices of the voting system includes executable code, configuration files, data files, and		This documentation is included in Software		
3.1.4-B	Discussion Software information	election specific software. Software installation documentation must include the following information for each piece of software to be installed or used to install		Installation.	VotingWorks staff reviews documentation.	Software Installation
3.1.4-6	Software information	software on programmed devices of the voting system:				
3.1.4-B.1		software product name		1		
3.1.4-B.2		software version number				
3.1.4-B.3		software manufacturer name		4		
3.1.4-B.4 3.1.4-B.5		software manufacturer contact information type of software (application logic, border logic, third party logic, COTS software, or installation software)		4		
3.1.4-B.5 3.1.4-B.6		list of software documentation		+		
3.1.4-B.7		component identifiers (such as filenames) of the software, and type of software component (executable code, source code, or data)		†		
3.1.4-B.8		flag to indicate whether or not the given software product should be considered "election-specific" (e.g., election-specific=[True False])		This documentation is included in Software		
		to differentiate software used for implementing essential election application logic functions (such as counting) from more generic		Installation.	V W. I	Coft and the Hotel
3.1.4-C	Software location information	software (such as generic file-system functions) Software installation documentation must include the location (such as full path name or memory address) and storage device (such as		+	VotingWorks staff reviews documentation.	Software installation
3.1 0		type and part number of storage device) where each piece of voting system software is installed on programmed devices of the voting				
		system.		N/A - software installation process writes over		
D	Discussion	This requirement applies to voting system software installed on programmed devices of the voting system. The full directory path is the		the entire disk. This is explained in Software Installation.	VotingWorks staff reviews desumentation	Software Installation
3.1.4-D	Discussion Election specific software identification	final destination of the software when installed on non-volatile storage with a file system. Software installation documentation must identify election specific software in the user documentation.		Installation.	VotingWorks staff reviews documentation.	Software installation
		This requirement applies to voting system software installed on programmed devices of the voting system. If the documentation can		1		
		provide information (such as what is indicated in item 8 from 3.1.4-B – Software information) then this should be sufficient to clearly				
D	Discussion	distinguish those pieces of software that perform essential election functions (such as counting) from those that perform more generic,		N/A - there is no election specific software. This is explained in Software Installation.	VotingWorks staff reviews documentation.	Software Installation
3.1.4-E	Installation software and hardware	non-election-specific tasks (such as those that might perform only general file-system operations, regardless of election concerns). Software installation documentation must include a list of software and hardware required to install software on programmed devices		This documentation is included in Software		Software Installation
		of the voting system in the user documentation.		Installation.	VotingWorks staff reviews documentation.	Software Installation
3.1.4-F	Software installation procedures	Software installation documentation must include the software installation procedures used to install software on programmed devices		This documentation is included in Software		
3.1.4-G	Baseline image creation	of the voting system in user documentation. To replicate programmed device configurations, the software installation procedures must create a baseline image of the initial		Installation. This documentation is included in Software	VotingWorks staff reviews documentation.	Software Installation
3.1.4-0	baseline image creation	programmed device configuration with storage media and mechanism for verifying the image's validity using a digital signature.		Installation.	VotingWorks staff reviews documentation.	Software Installation > Trusted Build
3.1.4-H	Programmed device configuration replication	The software installation procedures must use the baseline image and associated digital signature and digital signature validation		7	-	
		mechanism of the initial validated image to replicate the configuration onto other programmed devices.		-		
		The main point of this requirement is to ensure transitive immutability of a given device configuration (based on a valid, original image that corresponds to an original cryptographic signature). In this way, it seeks to ensure that the starting image that is used for the				
		replication of an image to a particular configuration or target device is the same as the one that was validated via digital signature				
		mechanisms. The process for dealing with varying details of alternative target platforms can be addressed with the use of modern				
		deployment technologies to create configurable installation mechanisms. This is not uncommon for major software technology				
		providers. Thus, technology providers will be expected to develop appropriate install and configuration mechanisms that can have configurable images that can be signed through this digital signature mechanism at the outset and when replicating to any target				
		configuration to ensure that both the image and the mechanisms for transforming that image in a given target deployment environment				
		have been understood and validated from the beginning. The above descriptions are meant to provide a way to validate a much wider				
		range of deployment scenarios than has been experienced in the past. As a result, it is not expected or intended that this process would		This documentation is included in Software		
D	Discussion	necessarily require strictly binary images, but rather, configurable ones, with the configuration settings and mechanisms for installation and signature verification provided, signed, and validated from the beginning.		This documentation is included in Software Installation.	VotingWorks staff reviews documentation.	Software Installation
3.1.4-I	Software installation record creation	The software installation procedures must specify the creation of a software installation record that includes at a minimum:	3.1.4-H - Programmed	1	G	
			device configuration			
3.1.4-I.1		a unique identifier (such as a serial number) for the record	replication	+		
3.1.4-1.1		a list of unique identifiers of storage media associated with the record		1		
3.1.4-1.3		the time, date, and location of the software installation		1

3.1.6-N	Ballot stock specification criteria	Maintenance documentation for optical scanners must include specifications for ballot materials to ensure that votes are read from only a single ballot at a time, without bleed-through or transferal of marks from one ballot to another.		Documentation is included in the technical data package.		System Performance Specifications > Paper Ballot Specifications
3.1.6-0	Printer paper specification	Maintenance documentation for voting systems that include printers must include specifications of the paper necessary to ensure correct operation and minimize jamming.		Documentation is included in the user manual.		User Manual > System Maintenance; System Performance Specifications > Paper Ballot Specifications
D	Discussion	This requirement covers all printers, either stand-alone or integrated with another device, regardless whether they are used for reporting, for logging, for voter verified paper records (VVPR), etc.		Documentation is included in the aser mandal.	voting votios stain reviews documentation.	Specifications
3.1.6-P	System maintenance, maintenance environment	Maintenance documentation must identify all facilities, furnishings, fixtures, and utilities that will be required for equipment maintenance.		Documentation is included in the user manual.	VotingWorks staff reviews documentation	User Manual > System Maintenance
3.1.6-Q	System maintenance, maintenance support and spares	Maintenance documentation must identify:			Total Brond stan Terrens decamentation	ose: manaar system mantenance
3.1.6-Q.1		recommended number and locations of spare devices or components to be kept on hand for repair purposes during periods of system operation				
3.1.6-Q.2		recommended number and locations of qualified maintenance personnel who need to be available to support repair calls during system operation				
3.1.6-Q.3		organizational affiliation (for example, jurisdiction, manufacturer) of qualified maintenance personnel		Documentation is included in the user manual.	VotingWorks staff reviews documentation.	User Manual > System Maintenance
3.1.7	Training Documentation					
3.1.7-A	Training Documentation	The manufacturer must describe the personnel resources and training required for a jurisdiction to operate and maintain the system.		Documentation is included in the user manual.	VotingWorks staff reviews documentation.	User Manual > Smart Cards and User Roles
3.1.7-B	Personnel	The manufacturer must specify the number of personnel and skill levels required to perform each of the following functions:		4		
3.1.7-B.1		pre-election or election preparation functions (such as, entering an election, contest and candidate information, designing a ballot, and generating pre-election reports)		_		
3.1.7-B.2		system operations for voting system functions performed at the polling place		-		
3.1.7-B.3		system operations for voting system functions performed at the central count facility		-		
3.1.7-B.4 3.1.7-B.5		preventive maintenance tasks diagnosis of faulty hardware, firmware, or software		 		
3.1.7-B.6		corrective maintenance tasks		When tasks are described in the user manual,		
3.1.7-B.7		testing to verify the correction of problems		the necessary role (implying skill level) is indicated.	VotingWorks staff reviews documentation.	User Manual
3.1.7-C	User functions versus manufacturer functions	The manufacturer must distinguish which functions may be carried out by user personnel and which must be performed by manufacturer personnel.		The user manual indicates when issues must be escalated to VotingWorks.	•	User Manual
3.1.7-D	Training requirements	The manufacturer must specify requirements for the orientation and training of administrators, central election officials, election judges, and election workers.		Documentation is included in the user manual.	-	User Manual > Smart Cards and User Roles
3.2	The process and transactions, both physical and digital, associated with the voting system are readily available for inspection					
3.2-A	Setup inspection process	Manufacturers must provide setup inspection process documentation that includes the setup inspection process that the voting device was designed to support including a description of the risks of deviating from the process.		Documentation is included in the user manual.	VotingWorks staff reviews documentation.	User Manual > Setup Inspection
D	Discussion	The setup inspection process provides a means to inspect various properties of voting devices as needed during the election process.				
3.2-B	Minimum properties included in the setup inspection process	Setup inspection process documentation must at a minimum include:				
3.2-B.1		inspecting voting system software		Documentation is included in the user manual.	•	User Manual > Setup Inspection
3.2-B.2		inspecting storage locations that hold election information that changes during an election		Documentation is included in the user manual.	•	User Manual > Setup Inspection
3.2-B.3		inspecting other voting device properties		Documentation is included in the user manual.	VotingWorks staff reviews documentation.	User Manual > Setup Inspection User Manual > Logic & Accuracy Pre-Election
3.2-B.4 3.2-C	Setup inspection record generation	executing logic and accuracy testing related to readiness of use in an election Setup inspection process documentation must describe the records that result from performing the setup inspection process.		Documentation is included in the user manual.	VotingWorks staff reviews documentation.	Testing User Manual > Setup Inspection; User
3.2-C	Installed software identification procedure	Setup inspection process documentation must describe the records that result from performing the setup inspection process. 	The public can understand and verify the operations of the voting				•	
3.3	system throughout the entirety of the election					
3.3-A	System security, system event logging	Manufacturers must provide publicly available documentation that:				
3.3-A.1		describes system event logging capabilities and usage				
3.3-A.2		fully documents the log format information				
		The log format and the meaning of all possible types of log entries must be fully documented in sufficient detail to allow independent				
D	Discussion	manufacturers to implement utilities to parse the log file. This documentation must be publicly available and not just in the TDP.				
3.3-B	Specification of common data format usage	Manufacturers must provide publicly available documentation describing how the manufacturer has implemented a CDF specification				
		for a particular device or function. This includes such items as:				
3.3-B.1		descriptions of how elements and attributes are used				
3.3-B.2		constraints on data elements				
3.3-B.3		extensions as well as any constraints				
		Conformance to a common data format does not guarantee data interoperability. The manufacturer needs to document fully how it has				
		interpreted and implemented a CDF specification for its voting devices and the types of data exchanged or exported. Here is list of				
		related references: NIST SP 1500-103 Cast Vote Records Common Data Format Specification [CVR_CDF], NIST SP 1500-100 Election				
D	Discussion	Results Common Data Format Specification [NIST16], NIST SP 1500-101 Election Event Logging Common Data Format Specification				
3.3-C	Discussion Bar and other codes	[LOG_CDF], NIST SP 1500-102 Voter Records Interchange(VRI) CDF Specification [VRI_CDF]. Manufacturers must provide publicly available documentation that fully specifies the barcode, how barcoded data is formatted, and any		_		
3.3-0	bal allu otilei codes	other encoding standards or methods used on ballots or audit material.				
		The voting system documentation needs to include the name and version of the standard used for barcodes or for any other codes that		1		
		encode information that the public sees on ballots or other material that can be used in audits or verification of the election. The				
		documentation also needs to include how the data may be packed or compressed within the encoding. The report should be sufficient				
D	Discussion	for a voter to understand the barcoded contents and for an auditor to develop applications that examine the barcoded contents.				
3.3-D	Ballot selection codes	The voting system must be capable of producing a report on an election-by-election basis to show the meaning of codes and other data				
		used within barcodes and CVRs to represent ballot selections and ballot style information.				
		Codes that represent a voter's ballot selections are commonly used within barcodes and CVRs so as to save space. The codes will likely				
		change for each election. The codes are meaningless to a voter or an auditor unless the voting system can produce a report that shows				
		all codes possible and what contests and ballot selections they represent. If, for example, a code of 90 is used to represent a particular		All VotinWorks documentation is public. This		
		contest, then the report must show that 90 refers to the title or description of that particular contest. This includes other information		specific documentation is also available in

5.2-E	Sound cues	Sound and visual cues must be coordinated so that:				
5.2-E.1		sound cues are accompanied by visual cues unless the system is set to audio-only				
5.2-E.2		visual cues are accompanied by sound cues unless the system is set to visual-only				
D	Discussion	The voting equipment might beep if the voter attempts to overvote. If so, there has to be an equivalent visual cue, such as the appearance of an icon or a blinking element. If the voting system has been set to audio-only, there would be no visual cue. Audio output also supports non-written languages, voters with low literacy, or voters with low vision. This requirement is based on WCAG 2.0 [W3C10] and Section 508 [USAB18].		Audio and visual cues are synced with the exception of when audio or visual-only mode is set by a voter in the voter settings.	VotingWorks functional testing confirms that audio and visual cues are synced with the exception of when VxMark is in audio or visual only mode.	User Manual > Voting Session Language & Settings; System Overview > VxMark Function
5.2-F	Presenting votes	At any time during a voting session, an electronic voting interface must allow the voter to change all language and display format options, and the interaction settings that the voter can chose directly, while preserving all current vote selections. When changing settings, the system must preserve navigation, screen position, visual settings, audio settings, and other information within and across contests.				
D	Discussion	A voter who initially chooses an English version of the ballot might switch to another language in order to read a referendum question. Many blind voters have preferences for audio settings, including the rate of speech and volume that are important for comprehension. Changing visual settings for text size might change the layout of the information on the screen, making it important to maintain the screen position. This requirement is based on WCAG 2.0 [W3C10] and Section 508 [USAB18].		A voter may change any voter facing settings during a voting session on VxMark and all voting state is preserved.	VotingWorks functional testing confirms that voter session state is preserved when changing voter facing settings.	User Manual > Voting Session Language & Settings; System Overview > VxMark Function

7.1-0	Toggle keys	The status of all locking or toggle controls or keys (such as the "shift" key) for the voting system available to the voter must be visually discernible, and also discernible through either touch or sound.		N/A - these types of		
		This applies to any physical controls or keys that have a locking or toggle function. This requirement is based on WCAG 2.0 [W3C10] and		locking/toggle/keys do not exist in		
D	Discussion	Section 508 (USAB18).		VxSuite.	'	
7.1-P	Identifying controls	Buttons and controls for the voter that perform different navigation or selection functions must be distinguishable by both shape and		7		
		color for visual and tactile perception. Well-known arrangements of groups of keys may be used only for their primary purpose. For				
		example, a full alphabetic keyboard is acceptable for entering a write-in candidate name, but individual keys cannot be used for				
		navigation or selection.				
		This applies to buttons and controls implemented either on-screen or in hardware. For on-screen controls, shape includes the label on				
		the button. Redundant cues help those with low vision. They also help individuals who have difficulty reading the text on the screen,				
		those who are blind but have some residual vision, and those who use the controls on a voting system because of limited dexterity. While this requirement primarily focuses on those with low vision, features such as tactile controls and on-screen controls intended				
		primarily to address one kind of disability often assist other voters as well. The Trace Center's EZ Access design is an example of button				
		functions distinguishable by both shape and color [TCnd]. Some examples are: Color can be helpful to make different sets of functions				
		visually distinct: groups of buttons can share a color, such as Volume UP/DOWN. Tactile perception requires different shapes, so that		All buttons on screen and in		
		finding a control does not rely solely on the layout: all the shapes cannot be squares, but two or four triangles can be used if they point		hardware are distinguishable by		
		in different directions. As a group of well-known keys, a full alphabetic keyboard is acceptable for entering a write-in candidate name,		shape and color. A full alphabetic	VotingWorks functional testing confirms all

D	Discussion	requirements, this applies to all display formats and interaction modes.		vote.	contest in all interaction modes.	User Manual > Voting Sessions
7.2-C	Voter control	An electronic ballot interface must give voters direct control over making or changing vote selections within a contest. This requirement				
		includes the following:	interaction options; 7.3 E - Feedback; 7.3-F -			
			Correcting the ballot			
7.2-C.1		In a vote-for-one contest, selecting a candidate may deselect a previously selected candidate, but the system must announce the	and the same	1		
		change in audio and visual display.		VxMark gives voters direct control		
7.2-C.2		In a vote-for-N-of-M contest, the system must not deselect any candidate automatically.		over making or changing	VotingWorks functional and automated	
7.2-C.3		In a vote-for-N-of-M contest, the system must inform the voter that they have attempted to make too many selections and offer an		selections per these	testing confirms VxMark navigation adheres	•
		opportunity to change their selections.		requirements.	to these requirements.	User Manual > Voting Sessions
7.2-C.4		Ballot options intended to select a group of candidates, such as straight-party voting, must provide clear feedback on the result of the		N/A - voting variation not		
7.2-C.5		action of selecting this option. Ballots with preferential or ranking voting methods must not re-order candidates except in response to an explicit voter command.		supported		
7.2-C.5		ballots with preferential of ranking voting methods must not re-order candidates except in response to an explicit voter command.		N/A - voting variation not supported		
		This requirement covers any selection, de-selection, or change to ballot options. It can be met in a variety of ways, including		Japported		
		notifications or announcements of the action the system is taking. For example, if a voter attempts to mark a selection for more				
		candidates than allowed, the system does not take an independent action to de-select a previously selected candidate, but instead				
		notifies the voter of the problem and offers ways to correct it. As with all requirements, this applies to all display formats and				
		interaction modes. This requirement addresses situations in which the voter cannot see the change take effect because the previously				
		selected candidate is on another screen, has scrolled off the visible display area, or is out of the voter's field of vision. It is particularly				
		important to voters using the audio format and no visual display because they often do not have a way to know that a change that				
		occurs higher up in the contest has taken place. Examples of feedback include visual changes on the screen and related sounds or				
		messages in text and audio. For example, selecting a candidate is often announced visually with a check-mark image and in audio by naming the candidate selected. If there is a visual change or announcement about the number of candidates selected (or selections still				
		available), for example, the audio says "you have selected the maximum number of candidates in this contest" in a vote-for-N contest.				
		An example of feedback on the result of a complex action, such as making a selection in straight-party voting, might be a message				
D	Discussion	confirming the party whose candidates were selected, or even the number of candidates and contests affected by the voter's action.

			Correctin gthe ballot;			
			7.3-H - Overvotes; 7.3-I			
			- Undervotes; 7.3-K -			
			Warnings, alerts, and			
			instructions			
7.2-D.1		The voting system may display the contest by:		7		
7.2-D.1.a		pagination - dividing the list of candidates or other information into "chunks," each filling one screen and providing ways for the voter to		7		
7.2 5.2.0		navigate among the different chunks; or				
7.2-D.1.b		scrolling – keeping all of the content on a single long display and providing controls that allow the voter to scroll continuously through		7		
7.2 0.1.0		the content.				
7.2-D.2		For either display method, the voting system interface must:		+		
_				-		
7.2-D.2.a		have a fixed header or footer that does not disappear, so voters always have access to navigation elements, the name of the current				
<u> </u>		contest, and the voting rules for the contest	1	4		
7.2-D.2.b		include easily perceivable cues in every display format to indicate that there is more information or there are more contest options				
		available		4		
7.2-D.2.c		include an option for an audio format and visual format that sync during scrolling		_		
7.2-D.3		The navigation method must ensure that the voting system:				
7.2-D.3.a		meets all requirements for providing feedback to the voter		7		
7.2-D.3.b		accurately issues all warnings and alerts including notifications of undervotes and overvotes		1		
7.2-D.3.c		meets all requirements for control size and interaction, and keeping all controls visible		+		
				-		
7.2-D.3.d		does not rely only on conventional platform scroll bars		4		
7.2-D.3.e		provides an opportunity to review and correct selections before leaving the contest				
		The ability to scroll through a list of candidates on a single logical page can be particularly important when a voter selects larger text or				
		is using the audio format. Information elements that need not scroll might include the name of the contest ("City Council Member"), the				
		voting rules ("vote for 1") and general controls including preference settings or navigation between contests. A scrolling interface that				
		meets this requirement offers voters a combination of easily perceivable controls or gestures to navigate through the list of candidates				
		or text of a ballot question. For example: Navigation within the contest does not rely on knowledge of any particular computer platform				
		or interface standard. Navigation within the contest does not only rely on conventional platform scroll bars, which operate differently				
		on two of the major commercial computer platforms. Controls have visible labels that include words or symbols. Controls are located in				
		the voter's visual viewing area at the bottom (or top) of the scrolling area, for example in the center of the column of names or				
		paragraph of text. This is especially helpful for people with low digital or reading literacy. Controls are identified in the audio format and				
		can be activated in all interaction modes. This overall requirement relates to 7.1-G – Text size (electronic display), 7.1-H – Scaling and		If the content does not fit on a		
		zooming (electronic display), and 7.3-B – No split contests. The controls used to meet this requirement also need to meet all other		single screen for a given display	VotingWorks functional and automated	
		requirements including 7.2-H – Accidental activation, 7.2.1 – Touch area size, 7.2-F – Voter speech, and 7.2-E – Touch screen gestures.		0 ' '	testing confirms that the "more" button is	
		Meeting requirements for notifications relates to 7.3-E – Feedback, 7.3-F – Correcting the ballot, 7.3-H – Overvotes, 7.3-I – Undervotes,		button to scroll through the	presented when content does not fit on a

/. <u>∠-</u> E	Touch screen gestures	Voting system devices used by voters with a touch screen may use touch screen gestures (physical movements by the user while in				
7251		contact with the screen to activate controls) in the interface if the following conditions are met:	H - Accidental activation	'		
7.2-E.1		Gestures are offered as another way of interacting with a touch screen and an optional alternative to the other touch interactions.		-		
7.2-E.2		Gestures work consistently across the entire voting interaction.		4		
7.2-E.3		Gestures do not include navigation off the current contest.		_		
7.2-E.4		Gestures are used in a way that does not create accidental activation of an action through an unintended gesture		⅃		
7.2-E.5		Gestures are limited to simple, well-known gestures				
7.2-E.6		Gestures do not require sequential, timed or simultaneous actions				
		This requirement ensures that the use of gestures does not interfere with the accessibility features of the voting system or make the		1		
		interface difficult to use by relying on an interaction mode with no easy way to make them perceivable in the visual or audio formats. In				
		relying on simple and common gestures, this requirement does not intend to fully duplicate the gestures for commercial mobile				
		platforms used with an audio format for accessibility. Tapping (touching the screen briefly) is the most basic gesture and is used on all				
		touch screens. Other commonly used gestures include: pinching or spreading fingers to zoom, swiping to scroll, and pressing and				
		holding to drag. Examples of gestures that require sequential or simultaneous actions are double-tapping, 2, 3 or 4 finger swiping, touch				
		and hold for a set period of time, or those that require coordinated actions with fingers on both hands. On desktop systems, assistive				
				Swining to scroll is the supported		
		preference options like Sticky Keys can make these complex gestures accessible, but they require familiarity beyond what is acceptable		Swiping to scroll is the supported

7.2-H	Accidental activation	Both on-screen and physical controls on the voting system must be designed to prevent accidental activation.	7.1-N - Tactile keys; 7.2-			
			E - Touch screen			
		The second leading line of a side about a single side of the second seco	gestures			
		There are at least two kinds of accidental activation: When a control is activated to execute an action as it is being "explored" by the voter because the control is overly sensitive to touch. When a control is in a location where it can easily be activated unintentionally. For				
		example, when a button is in the very bottom left corner of the screen where a voter might hold the unit for support. The draft of				
		WCAG 2.1, the next version of WCAG 2.0 [W3C10] includes a similar requirement and offers guidelines for preventing accidental				
		activation including that the activation be on the release of the control (an "up-event") or equivalent, or that the system provides an		Placement and sensitivity of all	VotingWorks functional and usability testing	
D	Discussion	opportunity to confirm the action. In addition to the accessibility needs for preventing accidental activation, it can be an issue if voters perceive the voting system as changing their voting selections.		controls are designed to prevent accidental activation.	confirms that no controls can be accidentally activated.	System Overview > VxMark Function
7.2-1	Touch area size	If the voting system has a touch screen, the touch target areas must:		accidental activation.	activateu.	System Overview > vxiviarx i diretion
7.2-I.1	Todan dred size	be at least 12.7 mm (0.5 inches) in both vertical and horizontal dimensions				
7.2-1.2		be at least 2.54 mm (0.1 inches) away from adjacent touch areas				
7.2-1.3		not overlap another touch area				
		The requirements for touch size areas on voting systems are larger than commercial standards for mobile devices: to ensure that the				
		touch areas are large enough for voters with unsteady hands; to ensure that voting systems allow full adjustment to the most				
		comfortable posture; and to allow for touch screens that do not include advanced algorithms to detect the center point of a touch. The required touch area size is larger than some of the commercial standards for mobile phones to allow for use by voters with limited				
		dexterity. The required marking area size is within sizes suggested in the draft WCAG 2.1 (the next version of WCAG 2.0 [W3C10]) for		All touch size areas on touch	VotingWorks functional and automated	
		target areas that accept a touch action. An MIT Touch Lab study of Human Fingertips to Investigate the Mechanics of Tactile		screens meet these size	testing confirms touch size areas meet these

7.2-M	No repetitive activation	Voting system keys or controls must not have a repetitive effect when they are held in an active position.		All voter facing keys and controls	VotingWorks functional testing confirms that	System Overview > VxScan; System
_		This is to preclude accidental activation. For instance, if a voter is typing in the name of a write-in candidate, depressing and holding the		have no repetitive effect when	voter facing keys and controls have no	Overview > VxMark
7.2-N	Discussion System response time	"e" key results in only a single "e" added to the name. This requirement is based on WCAG 2.0 [W3C10] and Section 508 [USAB18]. The voting system's response time must meet the following response times:		held.	repetitive effect when held.	
7.2-N 7.2-N.1	system response time	The system initially responds to a voter action in no more than:				
7.2-N.1.a		0.1 seconds for a visual change, and		1		
7.2-N.1.b		0.5 seconds for an audio response.				
7.2-N.2		The system responds to a voter marking a vote in no more than 1 second for both a visual response and an initial audio response.				
7.2-N.3		The system completes the visual response or display in no more than 1 second or displays an indicator that a response is still being				
		prepared.		4		
		This is so the voter can very quickly perceive that an action has been detected by the system and is being processed. The voter never				
		gets the sense of dealing with an unresponsive or "dead" system. Note that this requirement applies to both auditory and visual voting system responses. For example, if the voter touches a button to indicate a vote for a candidate, a visual system might display an "X"				
		next to the candidate's name, and an audio system might announce, "You have voted for John Smith for Governor". Even for "large"				
		operations such as initializing the ballot or painting a new screen, touch screen system ideally should not take more than 10 seconds. In				
		the case of audio systems, no upper limit is specified, since certain operations can take longer, depending on the length of the text being				
		read (for example, reading out a long list of candidates running in a contest). For instance, the system might present a progress bar indicating that it is "busy" processing the voter's request. This requirement is intended to preclude the "frozen screen" effect, in which		VxMark & VxScan meet these	VotingWorks functional testing confirms that	
		no detectable activity is taking place for several seconds. There need not be a specific "activity" icon, as long as some visual change is		system response times in	VxMark & VxScan response times to voter

7.3-M	Identifying languages	A vote-capture device or other voting session device that offers language options to a voter must:				
				VxMark and VxScan have a		
				language selection button shown	VotingWorks functional and automated	
7.3-M.1 7.3-M.2		visibly present the controls to identify or change language on the screen at all times, not hidden within a help or settings feature, include the native version of each language name in the list of language options.		on all voter facing screens with	testing confirms a language selection button	
7.5-101.2		Voters looking for an option for an alternative language can recognize it more easily as it is written in the language itself. The English		language selections translated as the native version of each	is persistent on all voter facing screens with the language translated as the native versior	
D	Discussion	name or spelling can also be used to identify language, along with the native name. Applies to: Electronic interfaces		language.	for all multi-language election packages.	
7.3-N	Instructions for voters	The voting system must provide voters access to instructions for all its operations at any time during the voting session.	5.1-F - Accessibility			
7.3-N.1		For electronic interfaces, the victims system must provide a way for victors to get help directly from the system	documentation			
7.3-N.1 7.3-N.2		For electronic interfaces, the voting system must provide a way for voters to get help directly from the system. For paper ballots, the system must be capable of including on the ballot both text and images with instructions for how to mark the		_		
7.52		ballot.				
7.3-N.3		Voting systems must present instructions near to where they are needed during the voting session.				
		The purpose of this requirement is to minimize voters' need for assistance from an election worker and to permit the voter to verify and				Hear Manual > Assisting Votors, Hear
		cast, privately and independently, the votes selected. When the system works correctly, the voter will find the help they need from the system when and where they need it. For instance, only general instructions should be grouped at the beginning of the ballot; those		Voter facing screens provide clear	•	User Manual > Assisting Voters; User Manual > VxMark > Voting Sessions;
		pertaining to specific situations should be presented near those situations. If an operation is available to the voter, it will be			VotingWorks functional and usability testing	System Overview > Hand Marked Ballots
		documented. Examples include how to make a vote selection, navigate among contests, cast a straight-party vote, cast a write-in vote,		of the voting process. Paper	confirms clear language instructions are part	
D	Discussion	adjust display and audio characteristics, or select a language. Electronic ballot interface systems often provide assistance with a distinctive "help" button. Instructions can be on the ballot itself or separate from the ballot, as long as the voter can find them easily.		ballots support instructional text as part of the balot design.	of all steps of the voting process across all marking methods.	
7.3-0	Instructions for election workers	The voting system must include clear, complete, and detailed instructions and messages for setup, polling, shutdown, and how to use	5.1-F - Accessibility	as part of the ballot design.	marking methods.	
		accessibility features.	documentation			
7.3-0.1		The documentation required for normal voting system operation must be:				
7.3-0.1.a 7.3-0.1.b		presented at a level appropriate for election workers who are not experts in voting system and computer technology in a format suitable for use in the polling place		_		
7.2-0.2		Printed procedural instructions, and on-screen instructions and messages must enable the election workers to verify that the voting				
		system				
7.3-O.2.a		has been set up correctly (setup)		_		
7.3-0.2.b 7.3-0.2.c		is in correct working order to record votes (polling), and has been shut down correctly (shutdown).		-		
7.5 0.2.0		This requirement covers documentation for those aspects of system operation normally performed by election workers and other "non-				
		expert" operators. It does not address inherently complex operations such as ballot definition. The instructions are usually in the form				
		of a written manual, but can also be presented on other media, such as a DVD or videotape. In the context of this requirement,				
		"message" means information delivered by the system to the election workers as they attempt to perform a setup, polling, or shutdown operation. Specific guidance on how to implement this requirement is contained in [NIST08]. For instance, the documentation should				
		not presuppose familiarity with personal computers. And a single large reference manual that simply presents details of all possible				
		operations would be difficult to use, unless accompanied by aids such as a simple "how-to" guide. It is especially important that election				
		workers and other non-expert workers know how to set up accessibility features which are not used frequently. This will help ensure voters who need these features can vote privately and independently. Overall, election workers should not have to guess whether a		Documentation is provided in the		
D	Discussion	system has been setup correctly. The documentation should make it clear what the system "looks like" when correctly configured.		user manual.	VotingWorks staff reviews documentation.	User Manual
7.3-P	Plain language	Information and instructions for voters and election workers must be written clearly, following the best practices for plain language.				
		This includes messages generated by the voting system for election workers in support of the operation, maintenance, or safety of the				
		system. The plain language requirements apply to instructions that are inherent to the voting system or that are generated by default. To the		+		
		extent that instructions are determined by election officials designing the ballot, they are beyond of the scope of this requirement. Any				
		legally required text is an exception to this plain language requirement. Plain language best practices are guidelines for achieving clear				
		communication and include: Using familiar, common words and avoiding technical or specialized words that voters are not likely to understand. For example, "There are more contests on the other side" rather than "Additional contests are presented on the reverse."				
		Issuing instructions on the correct way to perform actions, rather than telling voters what not to do. For example, "Fill in the oval for				
		your write-in vote to count" rather than, "If the oval is not marked, your write-in vote cannot be counted." Addressing the voter directly				
		rather than use passive voice when giving instructions. For example, "remove and retain this ballot stub" rather than "this ballot stub				
		must be removed and retained by the voter." Stating a limiting condition first, followed by the action to be performed when an instruction is based on a condition. For example, use "In order to change your vote, do X", rather than "Do X, in order to change your				
		vote." Avoiding the use of gender-based pronouns. For example, "Write in your candidate's name directly on the ballot" rather than		All information presented in the		
		"Write in his name directly on the ballot." For specific guidance on how to implement this requirement, see [NIST09a]. Although part of		product and product	VotingWorks functional and usability testing	
D	Discussion	general usability, using plain language is also expected to assist voters with cognitive disabilities. 9.1.1-A.1		The voting system must meet the requirements within the Paper-based System Architectures or Cryptographic E2E Verifiable System Architectures section, or both.				
9.1.1-A.2		The voting system documentation must include the method used to provide software independence.				
		Software independence [Rivest06] means that an undetected error or fault in the voting system's software is not capable of causing an undetectable change in election results. All voting systems need to be software independent in order to conform to the VVSG. There are two essential concepts behind applying software independence: it must be possible to audit voting systems to verify that ballots are being recorded correctly, and testing software is so difficult that audits of voting system correctness cannot rely on the software itself being correct. Therefore, voting systems need to be 'software independent' so that the audits do not have to trust that the voting system's software is correct. The voting system will provide proof that the ballots have been recorded correctly, that is, voting records will be produced in ways in which their accuracy does not rely on the correctness of the voting system's software. This is a major change				
		from previous versions of the VVSG because previous versions permitted voting systems that are software dependent, that is, voting systems whose audits rely on the correctness of the software. One example of a software dependent voting system is the DRE, which is now non-conformant to this version of the VVSG. There are currently two methods specified in the VVSG for achieving software independence: through the use of independent voter-verifiable paper records, and cryptographic E2E verifiable voting systems. Paper-based and cryptographic E2E verifiable system architectures are software independent and both can be used within the same voting				
		system. In this case where a voting system is identified as being a combination of both architectures, the system would need to be compliant with both sets of requirements. However, a system that meets all of the paper-based requirements need not satisfy the E2E-requirements even if it incorporates E2E verifiable functionality. Knowing the specific mechanism used to achieve software independence assists with determining if the system is truly is software independent. The documentation should explain how any			VotingWorks functional and automated	
D	Discussion	changes to the election outcome are detectable regardless of any fault or error in the voting system software. This may include how the voting systems handles a ballot after it is cast by the voter. For example, this documentation may answer the following questions: Is it able to print on the ballot? What information is printed on the ballot? Where is that information printed?		VxSuite has a paper-based system architecture as specified in the technical data package.	•	System Overview > Software Overview > Software Independence
9.1.2	Tamper Evidence	able to print on the bands: What information is printed on the bands: Where is that information printed:		teerimear data package.	and bandes cannot be modified when east.	Software independence
9.1.2-A	Tamper-evident records	The voting system must produce tamper-evident records that enable detection of incorrect election outcomes, including:		1		
		capturing the contents of each vote at the time of each ballot's casting, and		Ballots on VxScan & VxMark are		
		recording detected errors in a tamper-evident manner.		stored in a tamper-evident ballot		
D	Discussion	Tamper-evident records include CVRs, ballot images and artifacts from a cryptographic E2E verifiable voting system. The record also ensures that identified issues and other problems cannot be lost or unintentionally modified once they are discovered.		box once cast. CVRs for ballots		Contain Consider Audition Landing
9.1.2-B	Tamper-evident record creation	Paper records or other tamper-evident electronic records of the voter's ballot selections must be captured when each ballot is cast.		scanned on VxScan are continuously exported to external	VotingWorks functional testing confirms all	System Security, Auditing, Logging > Physical Security; System Security,

D	Discussion	CVRs and ballot images need sufficient data protection because they are needed for audits.		imported into VxAdmin.	records are signed and verified.	Artification Authentication
9.4	The voting system supports efficient audits				_	
9.4-A	Risk-limiting audit	A paper-based voting system must produce paper records that allow election officials to conduct a risk-limiting audit.	4.1-C - Exchange of cast vote records (CVRs); 9.1.5 - Paper records; 9.2-A - Audit support documentation; 9.4-C - Unique ballot identifiers; 9.4-D - Multipage ballots			
D 9.4-B	Discussion Random numbers supporting audit processes	Voting systems contain information which enables election officials to conduct risk-limiting audits. For example, batch subtotal reporting by the voting system, may make the process of ballot sampling more efficient. An evidence-based election requires convenient access to ballot sheets, ballot sheet images, and cast vote records for efficient and trustworthy public tabulation audits. Vendors should demonstrate how an election system provides all the information necessary for an independent Risk-Limiting Audit (RLA). Some example features/paper records that may be produced to support risk-limiting audits include the following: the ability to associate electronic cast vote records (CVRs) with corresponding paper records while also preserving ballot secrecy; the ability to export of CVRs in an open and interoperable format; the ability to create a ballot manifest that allows users to identify the physical location of ballots (e.g., scanner name or number, batch number, and ballot sequence number); and supporting multi-sheet ballots, including association of each sheet with its corresponding CVR. Voting systems that generate or rely on random or pseudo-random numbers for auditing purposes must document the method used to	9.4-C - Unique ballot	The artifacts required to support a batch-comparison or ballot-comparison risk-limiting audit are available as defined in the Audit Procedure in the TDP.	VotingWorks functional testing confirms post-election audits may be performed per audit documentation.	System Security, Auditing, Logging > Audit Procedure
9.4-8	Random numbers supporting audit processes	obtain the numbers and how the random numbers are used within the voting system.	identifiers; 10.2.2-E - Randomly generated identifiers			
D 9.4-C	Discussion Unique ballot identifiers	Various systems used to implement software independence require random numbers, whether for ballot selection for audits. This documentation should specify: how random numbers are generated, and what any random numbers are used for. One common use for random numbers is to create unique identifiers associated with ballots to assist in supporting audits. The method for generating the pseudo-random numbers should meet the requirement 10.2.2-E Randomly generated identifiers. For additional information, see NIST SP 800-90A, Recommendation for Random Number Generation Using Deterministic Random Bit Generators [NIST15a]. The voting system must enable election auditors to uniquely address individual ballots.		Random unique identifiers used in cast vote records, ballot images, and imprinted values on ballots are publicly documented in the TDP.	VotingWorks staff reviews documentation for completeness and accuracy.	System Overview > Cast Vote Records; System Overview > VxCentralScan Function
D	Discussion	This capability is needed to support RLAs. Although the voting system has this capability, this does not require jurisdictions to use this feature if it conflicts with state laws. In order to conduct a ballot-comparison risk-limiting audit, paper ballot records must either be stored in the order in which they were scanned or contain a unique ballot identifier. A unique ballot identifier is a unique ID that provides information about the device it was scanned on and the batch in which it is stored. One example of a unique ballot identifier is: scanner ID, batch ID, and ballot card number. The unique ballot identifier must not tie a ballot to an individual voter		Unique ballot identifiers are available in the cast vote record, associated ballot images, and imprinted value (when imprinting on VxCentralScan).	Functional and automated testing confirms a unique ballot identifier is present in cast vote records, ballot images, and on imprinted ballots.	
9.4-D	Multipage ballots	The voting system must be able to account for multipage ballots.		VxSuite supports multi-page hand marked paper ballots.	Functional and automated testing confirms that multi-page hand marked paper ballots are supported throughout voting system functionality.	System Overview > Hand Marked Ballots

		on random bit generators.	numbers supporting			
			audit processes; 10.2.2-D - Aggregating and			
			ordering			

VVSG 2.0 Section	Title	Requirement/Discussion Text	Related Requirements	How VxSuite Meets	How VotingWorks Tests	TDP Reference
D	Discussion	This requirement is important to ensure the use of a cryptographically secure pseudo-random number generator (CSPRNG) and also to ensure any random numbers, such as unique identifiers on a ballot, cannot be used to recreate the order in which a ballot was cast. Recreating the order of cast ballots can cause ballot secrecy issues if a voter's ballot can be identified. To ensure voting system vendors are following the random number generation recommendations in the 800-90 series, they will need to submit to the Cryptographic Module Validation Program (CAVP) and the Cryptographic Algorithm Validation Program (CAVP) for conformance testing. For additional information, see NIST SP 800-90A Rev 1, Recommendation for Random Number Generation Using Deterministic Random Bit Generators [NIST15a] and NIST SP 800-90B, Recommendation for the Entropy Sources Used for Random Bit Generation [NIST18a].		VxSuite utilizes the Node uuid library as a random bit generator, which leverages the operating system's FIPS-compliant OpenSSL implementation that meets NIST requirements.	VotingWorks software code review confirms NIST conforming random bit generation is used.	System Security, Auditing, Logging > System Security Architecture
10.2.3 10.2.3-A	Access to cast vote records (CVR) Restrict access to records of voter intent	The voting system must require administrator-level authorization to access the directory or storage location of CVRs, ballot images, and	11.3.1-B - Multi-factor	_

D	Discussion	Table 11-3 – Minimum permissions for each group or role defines the minimum functions according to user, voting stage, and system. Other capabilities can be defined as needed by jurisdiction.				
11.2.2-D	Applying permissions	The voting system must be capable of applying assigned groups or roles and permissions to authorized users.		administrators to assign roles to	VotingWorks functional and automated	
_		Once the user is assigned a group or role, the voting system needs to be capable of making the necessary changes to the user's		authorized users by programming	testing confirms that system administrators	System Overview > User Roles; User
D 11.3	Discussion The voting system supports strong, configurable authentication mechanisms to verify the identities of authorized users and includes multi-factor authentication mechanisms for critical operations	permissions. The permissions are changed based on the assigned group or role.		and providing smart cards.	can create valid smart cards.	Manual > Smart Cards and User Roles
11.3.1	Access control mechanisms			_		
11.3.1-A	Access control mechanism application	The voting system must use access control mechanisms to permit authorized access or prevent unauthorized access to the voting system.			VotingWorks functional and automated	
D	Discussion	Access controls support the following concepts: limiting the actions of users, groups or roles, and processes to those that are authorized; limiting entities to the functions for which they are authorized; limiting entities to the data for which they are authorized; and accountability of actions by identifying and authenticating users. Most modern operating systems natively provide configurable access control mechanisms that the voting system application can use.		VxSuite uses an access control system to prevent unauthorized access to the voting system.	testing confirms that critical aspects of the system cannot be accessed without valid authentication in the form of a smart card programmed by VxAdmin.	System Security, Auditing, & Logging > System Security Architecture > Access Control
11.3.1-B	Multi-factor authentication for critical operations	At a minimum, the voting system must be capable of using multi-factor authentication to verify a user has authorized access to perform critical operations, including:	8.4-A - Usability testing with election workers			
11.3.1-B.1		runtime software updates to the certified voting system	With election workers	N/A - VxSuite does not support runtime software updates so the requirement does not apply.		
11.3.1-B.2		aggregation and tabulation		Aggregation and tabulation require multi-factor election manager authentication.	VotingWorks functional and automated testing confirms that MFA is required for election managers to log in for aggregation and tabulation at VxAdmin.	System Overview > User Roles; User Manual > Smart Cards and User Roles
11.3.1-B.3		enabling network functions		N/A - This requirement does not apply because network functions cannot be enabled.		
11.3.1-B.4		changing device states, including opening and closing the polls		Opening or closing the polls requires poll worker authentication, which can be multi-factor if set in the system settings by the system administrator.	VotingWorks functional and automated testing confirms that MFA is required for poll workers to open or close polls if arePollWorkerCardPinsEnabled is true in the system settings.	System Overview > User Roles; User Manual > Smart Cards and User Roles; System Overview > Election Package
11.3.1-B.5		deleting or modifying the CVRs and ballot images		Deleting or modifying the CVRs and ballot images requires multi- factor election manager or system administrator authentication.	VotingWorks functional and automated testing confirms that MFA is required for election managers or system administrators to clear any election data.	System Overview > User Roles; User Manual > Smart Cards and User Roles
11.3.1-B.6		modifying authentication mechanisms		N/A - Authentication mechanisms cannot be changed.	•	
		NIST SP 800-63-3, Digital Identity Guidelines [NIST17c] provides additional information useful in meeting this requirement. NIST SP 800-63-3 defines multi-factor authentication (MFA) as follows: "An authentication system that requires more than one distinct authentication factor for successful authentication. Multi-factor authentication can be performed using a multi-factor authenticator or by a combination of authenticators that provide different factors. The three authentication factors are something you know, something you have, and something you are. Multifactor authenticators include, but are not limited to the following: Username & password Smartcard (for example, voter access card) iButton Biometric authentication (for example, fingerprint) Multi-factor authenticators can be tested for usability to ensure an appropriate balance of security, usability, and functionality. A significant impact to usability may

11.3.2	User authentication credentials					
11.3.2-A	Username and password management	If the voting system uses a username and password authentication method, the voting system must allow only the administrator to enforce password strength, histories, and expiration.		Users do not use a username and password authentication method, instead relying on smart cards and PINs.	ı	System Security, Auditing, & Logging > System Security Architecture > Password and Credential Policies
D	Discussion	This requirement extends [VVSG2005] I.7.2.1.2-e by requiring strong passwords, password histories, and password expiration.				
11.3.2-B	Password complexity	The voting system must, at minimum, meet the password complexity requirements within the latest version of NIST SP 800-63B Digital Identity Guidelines standards.		Smart card passwords are six-digit PINs in conformance with the guideline for memorized secrets randomly generated by a CSP described in the referenced document.	VotingWorks functional and automated testing confirms that all PINs are randomly generated six-digit numbers.	System Security, Auditing, & Logging > System Security Architecture > Access Control
D	Discussion	NIST SP 800-63B [NIST17d] does not specify any additional password complexity requirements besides password length. At the time of this writing, the only recommended password complexity requirement is a minimum password length of 8 characters. NIST SP 800-63B also recommends that if a password is provided to the user it may be 6 characters and all numeric. NIST's password complexity recommendations are meant to make it easier for users to memorize their passwords, while decreasing user frustration.				
11.3.2-C	Secure storage of authentication data	The voting system must store authentication data in a way that ensures confidentiality and integrity are preserved.		Smart card PINs are stored on the cards themselves. The software on the card will only confirm the PIN with a certified VotingWorks device. The hardware is tamperevident to prevent directly extracting the information.	VotingWorks penetration testing confirms that PINs cannot be extracted from a smart card with an uncertified device.	System Security, Auditing, & Logging > System Security Architecture > Access Control
D	Discussion	Ensuring the confidentiality of stored authentication data (such as passwords) may involve the use of cryptography. The best practice at the time of this writing is to store a salted, one-way hash of passwords. Additional guidance for protecting authentication data can be found in NIST SP 800-63B, Digital Identity Guidelines [NIST17d].				
11.3.2-D	Password disallow list	The voting system must compare all passwords against a manufacturer-specified list of well-known weak passwords and disallow the		7	VotingWorks automated testing confirms	System Security, Auditing, & Logging >
		use of these weak passwords.		Generated PINs avoid weak PINs such as 000000 or 123456.	that weak PINs are skipped when randomly generated.	System Security Architecture > Access Control
D	Discussion	Examples of common weak passwords include 0000, 1111, 1234.		-		
11.3.2-E	Usernames within passwords	The voting system must ensure that the username is not used in the password.		The requirement does not apply because there is no username associated with the password.		System Security, Auditing, & Logging > System Security Architecture > Access Control
D	Discussion	This requirement extends by restricting the use of usernames and related information in passwords.		-		
11.4	The voting system's default access control policies enforce the principles of least privilege and separation of duties					
11.4-A	Least privilege for access policies	By default, the voting system must implement the principle of least privilege including denying access to functions and data unless explicitly permitted.		VxSuite implements the principle of least privilege.		System Security, Auditing, & Logging > System Security Architecture > Defense-in-Depth and Least Privilege
D	Discussion	This requirement extends [VVSG2005] I.7.2.1.2-a by requiring explicit authorization of subjects based on access control policies. At the time of this writing, NIST SP 800-12 [NIST17e] defines "least privilege" as "the principle that a security architecture should be designed so that each entity is granted the minimum system resources and authorizations that the entity needs to perform its function." Network access will also follow the principle of least privilege to ensure that devices only receive as much access as is necessary to perform the desired function.				
11.4-B	Separation of duties	Voting system documentation must include suggested practices for dispersing critical operations across multiple groups or roles.		The user manual describes how system administrators should assign roles describes their permissions.	VotingWorks staff review all documentation.	User Manual > Smart Cards and User Roles
D	Discussion	Guidance for implementing separation of duties within the voting system is imperative to implement the separation of duties principle. Separation of duties is meant to divide user functions and roles so that there is no conflict of interest.			<u> </u>	
11.5	Logical access to voting system assets are revoked when no					
11.5 11.5-A	longer required Session time limits	The voting system must enable an administrator the ability to do the following:	11.5-B - Reauthentication	The system administrator can control the following through attributes in the system settings file imported into VxAdmin:	VotingWorks functional testing confirms that	System Security Auditing & Logging >
11.5-A.1		set the maximum time limit for a user's session		overallSessionTimeLimitHours	the system respects the session limits	System Security, Adulting, & Edgang > System Security Architecture > Access
11.5-A.2		set the maximum time limit for user inactivity		inavtiveSessionTimeLimitMinutes		Control; User Manual > Election Package
D	Discussion	NIST SP 800-63B [NIST17d] recommends a max session time of 12 hours regardless of inactivity and a max inactivity time of 30 minutes. Elections consist of temporary employees and user access may only be required during an election. A user's access may expire and terminate automatically at the end of an election.				
11.5-B	Reauthentication	The voting system must require reauthentication of an authorized user after the administrator-specified time limit for the user's session or for user inactivity.	7.2-O - Inactivity alerts; 11.5-A - Session time limits	All applications automatically log out the user after the inactivity period specified in the system settings, at which point the user must re-insert their card and reauthenticate.	VotingWorks functional and automated testing confirm that the user is logged out after the specified time-limits.	System Security, Auditing, & Logging > System Security Architecture > Access Control
		After authentication, a user's access to a voting system will time-out after a specified period of time. This will avoid unauthorized access to the voting system by unauthorized users. Once a user's access has timed-out, the user will have to re-authenticate to continue using the voting system. For voters, session times are specified under requirement 7.2-O – Inactivity alerts. For more information, see NIST SP				
D	Discussion	800-63B [NIST17d].				

VVSG 2.0 Section	Title	Requirement/Discussion Text	Related Requirements	How VxSuite Meets	How VotingWorks Test	TDP Reference
11.5-C	Account lockout	The voting system must lockout roles or individuals after an administrator-specified number of consecutive failed authentications attempts.			VotingWorks functional and automated testing confirm that the user is locked out after the specified number of failed authentication attempts.	System Security, Auditing, & Logging > System Security Architecture > Access Control; User Manual > Election Package
D	Discussion	This requirement prevents certain classes of password guessing attacks. This requirement can be implemented using a technique such as exponential backoff. NIST SP800-63B recommends allowing 5-10 attempts before starting exponential backoff. Exponential backoff requires that after each unsuccessful authentication attempt, the time period before another authentication attempt can be made grows exponentially. For instance: The wait after 1 unsuccessful authentication attempt is 0 seconds; The wait after 2 unsuccessful attempts is 2 seconds; The wait after 3 unsuccessful attempts is 4 seconds, and so on.				
11.5-D	Lockout time duration	The voting system must allow only an administrator to define the lockout duration.		The system administrator can set the initial lockout duration in the system settings with the startingCardLockoutDurationSeconds attribute.	VotingWorks functional testing confirms that the system respects the lockout duration specified in the system settings.	System Security, Auditing, & Logging > System Security Architecture > Access Control; User Manual > Election Package
D	Discussion	This requirement extends [VVSG2005] I.7.2.1.2 by allowing the administrator flexibility in configuring the account lockout policy. The lockout policy should not lockout voters.			•	-

D 12.1-E	Discussion Secure containers	Logging of the devices is vital for determining cause and providing incident information if a physical security event occurs. Unauthorized physical access to a container that stores or transports voting system records must result in physical evidence that an		or machine-shutdown log.	logs.	Logging
		unauthorized event has taken place.				
		The goal is to ensure that election workers or observers would easily notice if someone has tampered with the container. This requirement can be achieved through locks or seals as a part of tamper evidence and tamper resistance countermeasures described by		All VxSuite componetns have tamper-evident seals to provide	VotingWorks functional testing confirms	
		the use procedures and supplied by the manufacturer. Additionally, to support the requirements in Principle 9-Auditable, containers		physical evidence that	when tamper-evident seals are installed,	
D	Discussion	which hold either paper or electronic voting system records needed for audits need to be secure against physical access. An example of a physical container includes ballot boxes integrated and sold as part of the voting system. Applies to: Voter-facing scanners, BMDs		unauthorized access has taken place.	cases cannot be opened without breaking or defacing the seal.	System Security, Auditing, & Logging > Physical Security
12.1-F	Secure locking systems	If the voting system uses locks it must support locking systems for securing voting devices that are flexible enough to support different			C	,
		keying schemes, including a scheme that can make use of keys that are unique to each owner. A lock used on the voting system can be evaluated against UL437 door locks and locking cylinders requirements. See [UL13] for UL listing				
		for door locks and locking cylinders within the standard to review requirements for lockpicking and the attack resistance tests. The use				
		of a single key used to unlock thousands of precinct-based voting devices makes for a challenging security situation, as copies of this single key design are distributed to a large number of individuals. This creates a situation in which the key can be easily lost or stolen,				
		and subsequently copied. At the same time, this situation does make key management significantly easier for election officials. To				
		alleviate this situation, election officials might want keying schemes that are more or less restrictive in accordance with their election management practices and needs. This system can make use of replicable locks or cylinders, mechanisms which allow for rekeying of				
		locks, or other technologies. The requirement does not mandate a unique key for each piece of voting equipment but requires manufacturers to be able to provide unique keys for the voting equipment if requested by election officials. System owners need to				
D	Discussion	establish procedures for issues such as key reproduction, use, and storage.		N/A - VxSuite does not use locks.		
12.1-G	Backup power for power-reliant countermeasures	If the voting system uses a powered physical security countermeasure, that physical countermeasure must maintain its state when power is removed and must have a backup power supply. In addition, switching from primary power supply to backup power supply:				
		power is removed and must have a backup power supply. In addition, switching from primary power supply to backup power supply.				
12.1-G.1		produces an alert				
12.1-G.2		happens automatically when primary power is unavailable				
12.1-G.3		generates an event log entry, if possible This ensures that the countermeasure isn't disabled or intentionally circumvented by a power failure. Switching to the backup power				
		supply triggers an alarm that alerts an election worker to the issue so that any problem can be further diagnosed and eventually				
		resolved. The alarm can be visible and audible. Once primary power is unavailable, the switch to back up power should be automatic to avoid any gaps in functionality if the switch must be done manually. If the physical countermeasure leverages the voting system's				
		operating system, it can create an event log entry when it is switched to backup power. The log entry information is security relevant,		N/A - VxSuite does not use		
D	Discussion	especially once a security incident has occurred, and would be useful when determining cause. Alternatively, the voting system should log when there is a switch from backup power to the primary power supply.		powered physical security countermeasures.

D	Discussion	operations.				
13.4	The voting system protects the integrity, authenticity, and confidentiality of sensitive data transmitted over all networks.					
13.4-A	Confidentiality and integrity protection of transmitted data	The voting system must:				
13.4-A.1		mutually authenticate all network connections		N/A: The requirement does not		
13.4-A.2 13.4-A.3		cryptographically protect the confidentiality of all data sent over a network cryptographically protect the integrity of all election data sent over the network		apply because no data is sent ove a network.	r	System Security, Auditing, & Logging >
D D	Discussion	Mutual authentication provides assurance that each electronic device is legitimate. Mutual authentication can be performed using		a network.		Networking
		various protocols, such as IPsec and SSL/TLS. Only wired local area network (LAN) communication, such as ethernet, is possible for VVSG				
		2.0 voting systems. This requirement includes network appliances such as switches, firewalls, and routers within its scope. This does not				
		prevent the use of "double encrypted" connections employing cryptography at multiple layers of the network stack. Data, such as ballot images, must be encrypted before transmission. Integrity protection ensures that any inadvertent or intentional alterations to data are				
		detected by the recipient. Integrity protection for data in transit can be provided through the use of various protocols, such as IPsec				
		VPNs and SSL/TLS. For more information about TLS implementations, see NIST SP 800-52 rev. 2, Guidelines for the Selection, Configuration, and Use of Transport Layer Security (TLS) Implementations [NIST19b].				
		Comiguration, and use of mansport tayer security (115) implementations [Mish 130].

14.1-C.2		malware protection				Risk Assessment; System Security,
14.1-C.3		firewall access control lists, rules, and configurations		Documentation is included in the		Auditing, & Logging > System Security
14.1-C.4		system configurations		technical data package.	VotingWorks staff review documentation.	Architecture
		Risk assessments can be large, complicated documents. This requirement ensures that a single narrative exists to explain to election				
D 14.1-D	Discussion Procedural and operational security	officials and other system owners how the overall security operates for the voting system. The voting system must document necessary procedural and operational processes that need to occur to ensure integrity of the system.		Documentation is included in the		
14.1-0	Procedural and operational security	The voting system must document necessary procedurar and operational processes that need to occur to ensure integrity of the system.		technical data package.	VotingWorks staff review documentation.	User Manual > Setup Inspection
D	Discussion	Procedural and operational security processes play a key role in overall system security. If any of these procedures are necessary to ensure system integrity or system security, these practices need to be well documented and explained.			6	
	The voting system limits its attack surface by avoiding	ensure system integrity or system security, these practices need to be well documented and explained.		†		
	unnecessary code, data paths, connectivity, and physical ports, and by using other technical controls.					
14.2-A	Non-essential networking interfaces	The voting system must disable networking and other features that are non-essential to the function of the voting system by default.		7	VotingWorks functional testing confirms that	
	_				components do not have the hardware	
				All components have networking	necessary to connect to a network and, even	
				completely disabled with multiple layers of defense.	with network hardware, components do not have the software to utilize it.	System Security Architecture > Networking
		When the voting system is booted, networking and other functions are prohibited from running. For instance, networking interfaces		layers of defense.	have the software to utilize it.	Networking
		such as Wi-Fi and Bluetooth should be disabled. By disabling features that are non-essential to the voting system, this decreases the				
D	Discussion	attack surface by limiting the functionality and decreasing the entry points that may be accessed by unauthorized users.				
14.2-B	Network status indicator	If a voting system has network functionality, the voting system application must visually show an indicator within the management		This requirement does not apply		
		interface when networking functionality is enabled and disabled.		to VxSuite because there is no		
				networking functionality.		
D	Discussion	This helps to ensure that network functionality is not enabled by accident.		1		
14.2-C	Wireless communication restrictions	Voting systems must not be capable of establishing wireless connections as provided in this section.	8.1-E - Standard audio	7	VotingWorks functional testing confirms that	
			connectors; 15.4-C -	1 '	components do not have the hardware	
			Documentation for disabled wireless	without wi-fi or bluetooth cards and wireless connections are	necessary to connect to a wireless network and, even with wireless hardware,	System Socurity: Auditing & Logging
			disabled wireless	1	components do not have the software to	System Security; Auditing, & Logging > System Security Architecture >
				level.	utilize it.	Networking
		Wireless connections can expand the attack surface of the voting system by opening it up to over-the-air attacks. Over-the-air access		1		•
		can allow for adversaries to attack remotely without physical access to the voting system. By disallowing wireless capabilities in the				
		voting system, this limits the attack surface and restricts any network connections to be hardwired. Examples of how wireless can be				
		disabled may include the following: a system configuration process that disables wireless networking devices, disconnecting/unplugging wireless device antennas, or removing wireless hardware within the voting system. This requirement does not prohibit wireless				
		hardware within the voting system so long as the hardware cannot be used e.g. no wireless drivers present. This requirement applies				
		solely to voting systems that are within the scope of the VVSG. It is not a prohibition on wireless technology within election systems				
		overall. This requirement does not impact or restrict the use of assistive technology (AT) within the polling place. Voters with wireless				
D 14.3.D	Discussion Windows and the state in disease.	AT may have to use an adapter that leverages the 3.5 mm headphone jack.		This are assistant and a second and a		
14.2-D	Wireless network status indicator	If a voting system has network functionality, the voting system application must visually show an indicator within the management interface to confirm that wireless networking functionality is disabled.		This requirement does not apply to VxSuite because there is no		
		interiore to commit that whereas networking faired ording to also bed.		networking functionality.		
			15.4-B - Secure			
5	Dispussion	Note that this is in addition to the networking identifier. Wireless is a significant avenue for system compromise. This indicator ensures	configuration

VVSG 2.0 Section	Title	Requirement/Discussion Text	Related Requirements	How VxSuite Meets	How VotingWorks Test	TDP Reference
D 14.2-F	Discussion Secure configuration and hardening documentation	The basic instructions provided by a vendor should clearly indicate that the intended use and installation of voting systems implements an air gap between the voting system and external networks or external devices. This requirement is intended to limit the voting systems attack surface and disallow connections of the voting system to technologies such as: e-pollbooks, public switched telephone networks (PSTNs), and cellular modems. In particular, connections to the internet expand the attack surface even further than other wireless technologies because the data traverses over the internet, which reaches all over the world. This type of access allows a malicious actor to attack from various distances, meaning they do not have to be in close proximity of a polling place or near a specific jurisdiction. Exposure to the internet could allow nation-state attackers to gain remote access to the voting system. With remote access an attacker may be able to view all files within a voting system and make modifications to files within the voting system. These files may include election results and ballot records. This type of exposure could also make voting systems vulnerable to ransomware. Ransomware is a type of malware that could deny access to election data or functionality, usually by encrypting the data with a key known only to the hacker who deployed the malware. Ultimately an attacker could render a voting system non-operational until a ransom is paid. The voting system must follow a secure configuration guide for all underlying operating systems and other voting system components,	15.4-B - Secure network	Together, scripts across https:	now votingworks rest	i DF Neieleille
		with any deviations from the secure configuration guidance documented and justified.	configuration documentation	OS is configured correctly over the	Final quality control ensures that settings are correct. Settings must also inherently be correct to boot our final signed images, e.g., our signed images won't boot if Secure Boot is not enabled.	
D	Discussion	Properly configuring an operating system is a difficult and complex task, with small settings potentially causing a large impact. Industry, NIST, and various agencies within the DoD offer guidance for specific operating systems, as do OS and component manufacturers. Some examples include Security Technical Implementation Guides (STIGs) [DISA20] and the Center for Internet Security (CIS) benchmarks. Documenting deviations ensures that important settings are not overlooked and decisions to deviate are properly considered.				
14.2-G	Unused code	The voting system software must not contain unused, or dead code.		VxSuite does not contain dead code. VotingWorks engineering removes code whenever it becomes unused due to new code being introduced.	Full test coverage requirements force tests to run all code paths, which means no code is dead code. In libraries with limited test coverage, required manual code review ensures dead code is removed.	Quality Assurance Manual > Quality Assurance Protocols – Software
D	Discussion	An attacker may be able to take advantage of the unused code and introduce software bugs/exploits that can be used to make the voting system vulnerable. Dead code is source code that can never be executed in a running program because the surrounding code makes it impossible for a section of code to ever be executed. See MITRE CWE-561 [MITRE20]. Software with dead code is considered poor quality and reduces maintainability. This requirement does not restrict the use of defensive code, such as exception handling to prevent failures because this code is still traversed to check conditions.				
14.2-H	Use of exploit mitigation technologies	The voting system must use exploit mitigation technologies including data execution prevention (DEP) and address space layout randomization (ASLR), or equivalent mitigations.		DEP and ASLR are built into the Linux OS that the VotingWorks application is built on.	We've run commands to verify that these mechanisms are active. See the linked TDP section for details.	System Security, Auditing, & Logging > System Security Architecture > Defense- in-Depth and Least Privilege > DEP and ASLR
	Discussion	DEP and ASLR are commonplace exploit mitigation technologies that can help prevent a variety of vulnerability types, including memory corruption errors like buffer overflows. If the voting system does not use DEP and ASLR, the equivalent mitigation technologies used must be identified. Applications need to be written and compiled in such a way as to make use of underlying exploit mitigation technologies. See the OWASP Application Security Verification Standard [OWASP19] for more information about exploit mitigation.				
14.2-l	Importing software libraries	The voting system software must import only library components that are necessary.		Our Trusted Build process delineates all required dependencies and guarantees that only those dependencies are installed.		Software Installation > Trusted Build
D	Discussion	Importing entire software libraries significantly increases the attack surface of the software. Importing only the components of a library, such as modules, functions, or classes needed is a useful attack surface minimization strategy. Following the language's intended import design, such as importing only the specific module needed from a more general "standard" library, will also help with this goal. This requirement is not intended to encourage developers to avoid the import process by copying code directly to software, which would greatly complicate the update process. Not all 3rd party libraries are easily modifiable, making this attack surface reduction strategy				
14.2-J 14.2-J.1	Vulnerability management plan	impractical. The voting system documentation must include the plan for how to address vulnerabilities found in the voting system and at minimum include the following: how the voting system design process identifies and addresses well-known vulnerabilities				
14.2-J.2		disclosure of all known vulnerabilities within the system		†		
14.2-J.3		a patch management plan		Documentation is included in the		System Security, Auditing, & Logging >
14.2-J.4		the method to receive and send reports of vulnerabilities		technical data package.	VotingWorks staff review documentation.	Vulnerability Management
D	Discussion	This requirement informs how a voting system vendor is able to manage verified vulnerabilities to their voting system. Certain information can also be included for each vulnerability, such as any severity, impact, or exploitability scores. Tools like the Common Vulnerability Scoring System (CVSS) can be used to communicate the metrics (including the severity) of software vulnerabilities. For more information about vulnerability and patch management, see NISTIR 8011 Volume 4, Automation Support for Security Control Assessments: Software Vulnerability Management [NIST20c] and NIST SP 800-40, Guide to Enterprise Patch Management Technologies [NIST13b].				
	Known vulnerabilities	The underlying voting system platform must be free of well-known vulnerabilities as identified in the vulnerability management plan.		Documentation is included in the technical data package.	VotingWorks staff review documentation.	System Security, Auditing, & Logging > Vulnerability Management
D	Discussion	Vulnerability scanning tools can be used to identify known vulnerabilities in software and firmware. The U.S. National Vulnerability Database (NVD) is one resource that can be useful for identifying known vulnerabilities. Other vulnerability databases also exist and can be leveraged for full vulnerability coverage that might not be identified by automated scanning tools.				
14.3	The voting system maintains and verifies the integrity of software, firmware, and other critical components					
14.3 14.3-A	Supply chain risk management strategy	The voting system's documentation must contain a supply chain risk management strategy that at minimum includes the following:		†		
14.3-A.1	0	a reference to the template or standard used, if any, to develop the supply chain risk management strategy		This requirement does not apply because no template or standard was used.		

VVSG 2.0 Section	n Title	Requirement/Discussion Text	Related Requirements	How VxSuite Meets	How VotingWorks Test	TDP Reference
14.3-A.2		the assurance requirements to mitigate supply chain risks		_		
14.3-A.3		the contract language that requires suppliers and partners to provide the appropriate information to meet the assurance requirements of the supply chain risk management strategy				System Security, Auditing, & Logging >
14.3-A.4		the plan for reviewing and auditing suppliers and partners		Documentation is included in the		Hardware Criticality and Supplier
14.3-A.5		the response and recovery plan for a supply chain risk incident		technical data package.	VotingWorks staff review documentation.	Analysis
		Supply chain risks may include insertion of counterfeits, unauthorized production, tampering, theft, insertion of malicious software and hardware, as well as poor manufacturing and development practices in the technology supply chain. These risks are associated with an organization's decreased visibility into, and understanding of, how the technology that they acquire is developed, integrated, and deployed, as well as the processes, procedures, and practices used to assure the integrity, security, resilience, and quality of the products and services. These risks can be managed by following Appendix E of NIST SP 800-161 – Supply Chain Risk Management Practices (NIST15b) for Federal Information Systems and Organizations guidance (Appendix E provides a supply chain management plan (strategy template), utilizing the NIST Cybersecurity Framework Version 1.1 [NIST18c] by referencing the Supply Chain Risk Management category and subcategory, and referencing the relevant security controls for supply chain in NIST SP 800-53 Rev. 5 Security and Privacy				
_		Controls for Information Systems and Organizations [NIST20b]. Contract language provided must include the products or services				
D 14.3-B	Discussion Criticality analysis	acquired from the suppliers/partners and any evidence or artifacts that attest to the required level of assurance. The voting system's documentation must include a list of critical components and suppliers defined by a criticality analysis and supplier				System Security, Auditing, & Logging >
14.3-Б	Criticality alialysis	impact analysis		Documentation is included in the technical data package.	VotingWorks staff review documentation.	Hardware Criticality and Supplier Analysis
D	Discussion	Defining the critical components and supplier of the voting system can assist in prioritizing their importance to the voting process and identifying the impact to security, privacy and performance for failure or compromise. This can be supplemented by following NISTIR 8179 Criticality Analysis Process Model - Prioritizing Systems and Components [NIST18b] and NISTIR 8272, Impact Analysis Tool for Interdependent Cyber Supply Chain Risks [NIST20d].				
14.3-C	Bill of materials	The voting system's documentation must include the hardware and software information for the critical components defined in the 14.3-B and at minimum list the following information for each component:				
14.3-C.1		component name		1		
14.3-C.2 14.3-C.3		manufacturer model or version				System Security, Auditing, & Logging >
14.3-C.4		applicable platform for software (e.g., Windows or Linux)		Documentation is included in the technical data package.	VotingWorks staff review documentation.	Hardware Criticality and Supplier Analysis
		This requirement will use the critical components defined in the critical analysis of 14.3-B – Criticality analysis. At minimum the bill of materials for critical components are required, but this does not restrict the voting system vendor from listing the bill of materials for other components. This is a common practice when providing a hardware bill of materials. It is not as common to produce a bill of materials for software and as standards/best practices are developed, they should be considered for inclusion in the software bill of materials. For more information about the risks of third-party components and developing software bills of materials, see "Managing Security Risks Inherent in the Use of Third-party Components" [SAFECode19] and resources from the National Telecommunications and		common data pechaga.		,,
D	Discussion	Information Administration about Software Bills of Materials [NTIA19].		1		
14.3.1 14.3.1-A	Boot Integrity Cryptographic boot verification	The voting system must cryptographically verify firmware and software integrity before the operating system is loaded into memory.		VxSuite components use dm- verity to verify that software has not been tampered with.	VotingWorks functional testing confirms that only signed and unmodified software can be booted successfully on a locked down machine.	System Security, Auditing, & Logging > System Security Architecture > System Integrity
D	Discussion	This requirement does not mandate hardware support for cryptographic verification. This requirement could be met by trusted boot, but other software-based solutions exist. This includes a software bootloader cryptographically verifying the OS prior to execution. Verifying the bootloader itself is excluded from this requirement, but not prohibited. Applies to: Vote-capture and tabulation device, EMS				•
14.3.1-B	Preventing of boot on error	If the voting system fails boot validation, the voting system must not boot and provide an onscreen alert.		If the secure boot dm-verity check fails, the voting system will not boot and the error is presented on screen.	VotingWorks functional testing confirms that boot fails and a notification occurs when secure boot detects modified code. This can only be tested special development software releases that allow editing code.	System Security, Auditing, & Logging > System Security Architecture > System Integrity
D	Discussion	System users need to be notified when the voting system is either corrupted or has been maliciously modified. Boot validation prevents unauthorized operating systems and software from being installed or run on a system. Applies to: Vote-capture and tabulation device, EMS				
14.3.1-C	Notification of boot validation failure	If the voting system does not pass boot validation, it must present an on-screen alert and provide any other necessary information to understand the failure.		If the secure boot dm-verity check fails, the voting system will not boot and the error is presented on screen.	VotingWorks functional testing confirms that a notification occurs when secure boot detects modified code. This can only be tested special development software releases that allow editing code.	System Security, Auditing, & Logging > System Security Architecture > System Integrity
D	Discussion	Failure of boot validation needs to be provided to users so these errors can be further analyzed when needed. If the voting system is capable of pre-boot logging, failure information could be stored in a log for future analysis. Applies to: Vote-capture and tabulation, EMS				
14.3.2 14.3.2-A	Software Integrity Installing software	The voting system must only allow digitally signed software and firmware to be installed.		\\.\.\.\.\.\.\.\.\.\.\.\.\.\.\.\.\.\.\		
D	Discussion	Signed software and firmware ensures that it is not modified before installation, and that it is being distributed by the proper entity.		VxSuite prevents unsigned software and firmware from being		
14.3.2-B	Software verification for installation	The voting system must cryptographically verify the digital signature of software and firmware before it is installed.		installed by using secure boot to	VotingWorks functional testing confirms that	
D	Discussion	The security properties of integrity and authenticity are not achieved unless the digital signature for the signed software and firmware is cryptographically verified.		only allow booting signed VotingWorks images.	attempts to install unsigned software fail due to failed secure boto checks.	System Security Architecture > System Integrity; Software Installation
14.3.2-C	Application allowlisting	The voting system must only run applications that have been verified against an allowlist.		Allowlists are not relevant to VxSuite's security architecture.		
D 1433 D	Discussion	This requirement helps ensure only authorized applications run on the voting system. Applies to: Vote-capture device		The voting system components		6.46
14.3.2-D	Integrity protection for software allowlists Discussion	The voting system must protect the integrity and authenticity of the allowlist configuration files. If the allowlist is improperly modified, the software allowlisting mitigation can be defeated. The most common way of providing allowlist configuration file protection could be a digital signature.		can only run the installed application and new applications cannot be added.		System Security, Auditing, & Logging > System Security Architecture > System Integrity
	Voting system software updates are authorized by an			1		0:1

VVSG 2.0 Section	Title Detection and Monitoring - The voting system provides	Requirement/Discussion Text
15	mechanisms to detect anomalous or malicious behavior.	
	Voting system equipment records important activities through	
	event logging mechanisms, which are stored in a format suitable	
15.1 15.1-A	for automated processing. Event logging	The voting system must be capable of logging events that occur in a voting system.
15.1-A	Event logging	The voting system must be capable of logging events that occur in a voting system.
D	Discussion	The ability to log events within a system allows for continuous monitoring of the voting system. These logs provide a way for administrators to analyze the voting system's activities, diagnose issues, and perform necessary recovery and remediation actions.
15.1-B	Exporting logs	The voting system must be capable of exporting logs.
D	Discussion	Exporting logs offers the opportunity for external review, clearing storage, and a method to compare with future logs.
15.1-C	Logging voter information	The voting system must not log any information:
15.1-C.1		identifying a specific voter
15.1-C.2		connecting a voter to a specific ballot
		No voter information is stored anywhere within voting system logs. This would violate voter ballot secrecy because it can link a voter to
D	Discussion	their ballot selections.
15.1-D	Logging event types	At minimum, the voting system must log the events included in Table 15-1.
15.1-D.1 15.1-D.1.a		General System Functions Device generated error and exception messages - Includes but is not limited to: The source and disposition of system interrupts resulting
15.1-0.1.8		in entry into exception handling routines. Messages generated by exception handlers. The identification code and number of
		occurrences for each hardware and software error or failure. Notification of physical violations of security. Other exception events such
		as power failures, failure of critical hardware components, data transmission errors, or other types of operating anomalies. All faults and
		the recovery actions taken. Device generated error and exception messages such as ordinary timer system interrupts and normal I/O system interrupts do not need to be logged.
15.1-D.1.b		Critical system status messages - Critical system status messages other than information messages displayed by the device during the
		course of normal operations. Includes but is not limited to: Diagnostic and status messages upon startup; The "zero totals" check
		conducted before opening the polling place or counting a precinct centrally; For paper-based systems, the initiation or termination of scanner and communications equipment operation; Printer errors; Detection or remediation of malware or other malicious software;
		Cryptographic boot validation success/failure
15.1-D.1.c		Non-critical status messages - Non-critical status messages that are generated by the device's data quality monitor or by software and
45 4 5 4 1		hardware condition monitors
15.1-D.1.d		Events that require election official intervention - Events that require election official intervention, so that each election official access can be monitored, and access sequence can be constructed
15.1-D.1.e		Device shutdown and restarts - Both normal and abnormal device shutdowns and restarts
15.1-D.1.f		Changes to system configuration settings - Configuration settings include but are not limited to registry keys, kernel settings, logging
15151		settings, and other voting device configuration settings
15.1-D.1.g		Integrity checks for executables, configuration files, data, and logs - Integrity checks that can indicate possible tampering with files and data
15.1-D.1.h		The addition and deletion of files - Files that are added or deleted from the voting device
15.1-D.1.i		System readiness results - Includes but is not limited to: System pass or fail of hardware and software test for system readiness;
		Identification of the software release, identification of the election to be processed, polling place identification, and the results of the
		software and hardware diagnostic tests; Pass or fail of ballot style compatibility and integrity test; Pass or fail of system test data removal; Zero totals of data paths and memory locations for vote recording
15.1-D.1.j		Removable media events - Removable media that is inserted into or removed from the voting device
15.1-D.1.k		Backup and restore - Successful and failed attempts to perform backups and restores.
15.1-D.2		Authentication and Access Control
15.1-D.2.a		Authentication related events - Includes but is not limited to: Login/logoff events (both successful and failed attempts); Account lockout events; Password changes
15.1-D.2.b		Access control related events - Includes but is not limited to: Use of privileges (such as a user running a process as an administrator);
		Attempts to exceed privileges; All access attempts to application and underlying system resources; Changes to the access control
		configuration of the voting device
15.1-D.2.c		User account and role (or groups) management activity - Includes but is not limited to: Addition and deletion of user accounts and roles; User account and role suspension and reactivation; Changes to account or role security attributes such as password length, access
		levels, login restrictions, and permissions; Administrator account and role password resets
15.1-D.3		Networking
15.1-D.3.a		Enabling or disabling networking functionality - Includes but is not limited to: Wired networking; Wireless networking
15.1-D.4		Software
15.1-D.4.a		Installing, upgrading, patching, or modifying software or firmware - Logging for installation, upgrading, patching, or modifying software or firmware include logging what was installed, upgraded, or modified as well as a cryptographic hash or other secure identifier of the
		of firmware include logging what was installed, upgraded, or modified as well as a cryptographic hash or other secure identifier of the old and new versions of the data.

The voting system logs events that VotingWorks functional testing confirms that occur in the system. More information can be found in the logs are created and available in the exported System Security, Auditing, & Logging > logging documentation. Logging A system administrator can, at any time, export logs in full, export error-only logs, or export the logs in CDF format. More VotingWorks functional and automated information can be found in the testing confirms that system administrators System Security, Auditing, & Logging > logging documentation. can always export logs. Logging VotingWorks staff manually audit all code changes to ensure that logs containing voter identifiable information are not introduced to the system. A final code review audit was performed of all points in the code where a log is emitted to ensure that no voter identifying information could be recorded. All logs produced by VxSuite applications do not contain any Logs are exported from VotingWorks information that could identify a applications in functional testing and checked System Security, Auditing, & Logging > voter or tie a voter to a ballot. for unexpected identifying information.

How VotingWorks Test

TDP Reference

How VxSuite Meets

15

VVSG 2.0 Section	Title	Requirement/Discussion Text	How Westite Maste	How Voting Works Tost	TDP Reference
15.1-D.4.b	Title	Changes to configuration settings - Includes but is not limited to: Changes to critical function settings. At a minimum, critical function	How VxSuite Meets	How VotingWorks Test	IDP Keterence
10:12 2:0		settings include location of election definition file, contents of the election definition file, vote reporting, location of logs, and voting			
		device configuration settings; Changes to device settings including, but not limited to, enabling and disabling services; Starting and			
		stopping processes	4		
15.1-D.4.c		Abnormal process exits - All abnormal process exits.	4		
15.1-D.4.d 15.1-D.4.e		Successful and failed database connection attempts (if a database is uses) - All database connection attempts. Changes to cryptographic keys - At a minimum, critical cryptographic settings include key addition, key removal, and re-keying.	+		
15.1-D.4.e		Voting Functions	+	National Alamba at affirmation wheat all an actional	
15.1-D.5.a		Ballot definition and modification - During election definition and ballot preparation, the device can provide logging information for	†	VotingWorks staff review that all required VVSG 2.0 log events are covered by	
13.1 0.3.4		preparing the baseline ballot formats and modifications to them, including a description of the modification and corresponding dates.	Each logging requirement is	VotingWorks log events. VotingWorks	
		Includes but is not limited to: The account name that made the modifications. A description of what was modified including the file	mapped to its VotingWorks log	functional and automated testing confirms	
15.1-D.5.b		name, location, and the content changed. The date and time of the modification Voting events - Includes: Opening and closing polls; Casting a vote; Canceling a vote during verification; Success or failure of log and	event in the 15.1-D table in System Security, Auditing, &	that when these events occur the appropropriate logs are actually emitted and	System Security, Auditing, & Logging >
13.1 2.3.5		election results exportation; Note: for paper-based devices, these requirements might need to be met procedurally.	Logging > Logging	readable in the exported logs.	Logging
15.1-E	Configuration file access log	When a system administrator is accessing a configuration file, the voting system must log identifying information of the group or role accessing that file.	System administrators cannot access configuration files at the operating system level. Whenever a system administrator imports or exports configuration for an election, that event is logged. See		
			event codes save-election- package-init, save-election- package-complete, and election-	VotingWorks function penetration confirms that system configuration files are inaccessible and election configuration	System Security, Auditing, & Logging > System Security Architecture; System
			package-load-from-usb-complete.	actions generate log events.	Security, Auditing, & Logging > Logging
D	Discussion	A record of who modified a configuration file is important for auditing and accountability. The identifying information could include the username or the name of the user for improved traceability.			
45.2	The voting system generates, stores, and reports all error				
15.2 15.2-A	messages as they occur. Presentation of voting application errors	The voting system must provide immediate notification to the user when a voting application error occurs.	All errors result in the immediate	VotingWorks testing staff confirm that all	
13.2-A	rresentation of voting application errors	The voting system must provide immediate nouncation to the user when a voting application error occurs.	presentation of the error to the user.	encountered errors are accompanied by user notifications.	User Manual; User Manual > [Component] Error Messages
D	Discussion	Voting application errors can disrupt a voter's voting session. Immediate notification of an issue or an error allows for prompt recovery and remediation.			
15.2-B	Voting application error handling documentation	The voting system documentation must include procedures for handling voting application errors.	Documentation is included in the		User Manual; User Manual >
D	Discussion	Decemberation will assist alastina officials with store to propose a december of the store to propose a store of the store	user manual.	VotingWorks staff review documentation.	[Component] Error Messages
15.2-C	Logging system errors	Documentation will assist election officials with steps to properly address errors. The voting system must log system errors.	All errors result in an entry in the	VotingWorks functional and automated	
10.2 0	2088 in 8 system errors	The following speciment of the first of the	audit log record with the	testing confirms that system errors are	System Security, Auditing, & Logging >
			disposition of failure.	logged.	Logging
D	Discussion	This requirement ensures that any system errors are logged for analysis and remediation. System errors do not include user errors, such as undervotes or overvotes.			
15.2-D	Creating error reports	The voting system must be capable of creating error reports.	A system administrator or election	VotingWorks functional and automated	User Manual > Retaining and Removing
			manager can export error-only logs on all VxSuite devices.	testing confirms that error-only logs can be exported and contain the appropriate logs.	Files; System Security, Auditing, & Logging > Logging
D	Discussion	Error reports allow system administrators to easily analyze the errors that occurred within a system.	logs on all vasalte devices.	exported and contain the appropriate logs.	ropping > ropping
15.3	The voting system is designed to protect against malware.		1		
15.3-A	Malware protection mechanisms	COTS workstations providing EMS functionality must deploy mechanisms to protect against malware.	1	VotingWorks functional testing confirms that	
				attempts to edit or add executables are	
			added or executed after	blocked and, when allowed for testing purposes, result in the device failing secure	System Security, Auditing, & Logging >
			installation.	boot.	Integrity
		NIST SP 800-83 Revision 1 Guide to Malware Incident Prevention and Handling for Desktops and Laptops [NIST13a] might be useful as	1		
		supplemental guidance for protecting against malware. Malware protection mechanisms are not required for voter-facing scanners and			
		electronic BMDs. Alternatively, voter-facing scanners and electronic BMDs are required to use protection mechanisms, such as digital signatures and allowlists. This requirement is focused on EMS COTS workstations and does not include peripherals devices (e.g.,			
D	Discussion	printers).			
15.3-B	Updatable malware protection mechanisms	The malware protection mechanisms for COTS devices providing EMS functionality must be updatable.	N/A - This requirement does not		
			apply to VxSuite. Because VxSuite		
			protects against malware by		
			preventing any new executables from being added to the system,		
			there is no purpose in maintaining		
			or updating a catalog of malware		
		Malurara protection machanisms tunically use a fet was size to the first the first tuning to the first tuning to the first tuning tunin	signatures.		
		Malware protection mechanisms typically use software signatures to identify malware. As new malware signatures are received, the malware protection mechanism needs to be updated with the new signatures to ensure it is identifying all known malware. Applies to:			
D	Discussion	EMS Workstations, vote-capture and tabulation devices.			
15.3-C	Documenting malware protection mechanisms	The voting system documentation must include the process and procedures for updating malware protection mechanisms.	N/A - This requirement does not		
			apply to VxSuite. Because VxSuite		
			protects against malware by preventing any new executables		
			from being added to the system,		
			there is no purpose in maintaining		
			or updating a catalog of malware		
		Providing documentation of the procedures to configure the malware protection mechanisms assists with ensuring the malware	signatures.		
	Discussion	protection mechanisms are properly updated to meet 15.3B- Updatable malware protection mechanisms.

VVSG 2.0 Section	Title	Requirement/Discussion Text	How VxSuite Meets	How VotingWorks Test	TDP Reference
15.3-D	Notification of malware detection	COTS workstations and servers providing EMS functionality must immediately notify an election official when malware is detected.		VotingWorks functional testing confirms that	
			If malware were detected on	a notification occurs when secure boot	Contain Consists Audition Classics
			boot, the boot fails and presents the election official with a	detects modified code. This can only be tested special development software releases	System Security, Auditing, & Logging > System Security Architecture > System
			notification.	that allow editing code.	Integrity
		Malware on an EMS device can disrupt the integrity of the data on the EMS device. Once malware is detected, immediate notification of			
D	Discussion	malware detection allows election officials to promptly take the proper action to avoid data integrity issues. This requirement is focused on EMS COTS workstations and does not include peripheral devices (e.g., printers).			
15.3-E	Logging malware detection	The voting system must log instances of detecting malware.		VotingWorks functional testing confirms that	
				appropriate logs are produced when secure	
			If malware were detected on	boot detects modified code. This can only be	Contain Consider Audition Classica
			boot, the failed dm-verity check would result in a log entry.	tested special development software releases that allow editing code.	Logging
15.3-F	Notification of malware remediation	COTS workstations and servers providing EMS functionality must provide a notification upon the removal or remediation of malware.	N/A - This requirement does not	that allow cutting code.	20888
			apply to VxSuite because VxSuite		
			protects against malware by		
			preventing any new executables from being added to the system,		
			so there is no removal or		
			remediation process. If malware		
			were detected, the device would be unusable and returned to		
			VotingWorks for inspection.		
		Once malware it is identified on a device, operations can cease until the malware is remediated. This notification allows administrators	5 - 7 - 1 - 1 - 1 - 1 - 1		
		and officials to know when it is safe to resume normal operations. This requirement is focused on EMS COTS workstations and does not			
D 15.3-G	Discussion Logging malware remediation	include peripherals devices (e.g., printers) The voting system must log malware remediation activities.	N/A - This requirement does not		
15.5-0	Logging malware remediation	The voting system must log malware remediation activities.	apply to VxSuite because VxSuite		
			protects against malware by		
			preventing any new executables		
			from being added to the system, so there is no removal or		
			remediation process. If malware		
			were detected, the device would		
			be unusable and returned to		
		Remediation that requires the reimaging or reinstallation of the OS, may need to be logged external to the voting system. Prior to	VotingWorks for inspection.		
		reimaging, the malware detection logs could be downloaded and stored on another system to capture the time stamp of the malware			
D	Discussion	event and preserve the malware event log for further analysis.			
	A voting system with networking capabilities employs appropriate, well-vetted modern defenses against network-based				
15.4	attacks, commensurate with current best practices.				
15.4-A	Internal network architecture documentation	The voting system documentation must include the network architecture of any internal network used by any portion of the voting	N/A - This requirement does not		
		system.	apply because VxSuite devices are	9	
			not networked and cannot be networked.		
		Documentation of the internal network architecture can assist with data flow analysis, proper network configuration, and architecture	networked.		
D	Discussion	to properly support the voting system. Applies to: Voting systems with networking capabilities			
15.4-B	Secure network configuration documentation	The voting system documentation must list security configurations and be accompanied by network security best practices.	N/A - This requirement does not		
			apply because VxSuite devices are not networked and cannot be		
			networked.		
		This documentation may include how external network services are not included as part of the voting system and are handled through a			
		separate air-gapped process. For example, a sneaker-net process may be used to manually transfer elections results to another system			
		that uses public telecommunications to transmit the unofficial election results to a central count center. A variety of documentation providing secure configurations for network devices is publicly available from the US government. If outside manufacturers provide			
		guidance and best practices, these need to be documented and used to the extent practical. This documentation may also include the			
		use of firewalls and intrusion detection systems (IDS). Firewalls and IDSs are typically used to control and monitor the boundary			
		between a private network and the internet. Although the current requirements do not allow for internet connectivity, firewalls and			
D	Discussion	IDSs may also be used for internal boundaries and monitoring inside a private network. Guidance for Intrusion Detection and prevention systems can be found in NIST SP 800-94: Guide to Intrusion Detection and Prevention Systems [NIST07].			
15.4-C	Documentation for disabled wireless	The voting system documentation must include information about how wireless is disabled within the voting system.			System Security; Auditing, & Logging >
		,	Documentation is included in the		System Security Architecture >
			technical data package.	VotingWorks staff reviews documentation.	Networking
		Documentation for how the voting system is configured to disable wireless networking is important to meet requirement 14.2-D – Wireless network status indicator, which disallows the use of any wireless connections. Example information for how wireless can be			
		disabled may include the following: a system configuration process that disables wireless networking devices, disconnecting/unplugging			
		wireless device antennas, and removing wireless hardware within the voting system. A variety of documentation providing secure			
		configurations for network devices is publicly available from the US government. If outside manufacturers provide guidance and best			
D 15 4 D	Discussion Pula and policy undetes	practices exist, these need to be documented and used to the extent practical. Applies to: Voting systems with networking capabilities			
15.4-D	Rule and policy updates	The voting system must be capable of updating rules and policies for network appliances. Network appliances and the voting system are constantly receiving improvements and information related to current threats. As this	apply to VxSuite because there are no network appliances.		
	Discussion	information is released, rules and policies might need to be modified to adjust to new capabilities.	are no network appliances.		
D	Discussion
